Attachments: Transport Scotland Response, NA2 Transport Assessment, Nairn ISSUE.PDF

Good afternoon [Redacted]

I trust you are well. Many thanks for your comments regarding your audit of our Transport Assessment, prepared in support of the 'NA2' development proposals in Nairn.

We have since reviewed these comments and prepared an appropriate response which I trust helps address Transport Scotland's queries.

Kind regards,

[Redacted]

Arup

[REDACTED]

Could you advise if you have as yet finalised your review of the TA. We are looking at a committee date to be finalised by end of March therefore timeframes are getting tight for ARUP to come back to you.

Many thanks

Regards

[REDACTED]

I would confirm that Transport Scotland is in the process of finalising our review of the TA. This has identified some points that will require further clarification from ARUP prior to responding to THC on this application however, we will liaise directly with ARUP on this asap.

I trust the above is of assistance however, in the meantime, please do not hesitate to contact me should you have any queries.

Regards

█

The response time will obviously be dependent on the outcome of our audit of the TA. This process would have been assisted had ARUP consulted Transport Scotland when seeking to agree the scope of assessment, particularly given the potential for the proposed development to impact on a sensitive part of the trunk road network.

Notwithstanding this, we will liaise with ARUP as necessary and would anticipate being in a position to respond before the end of February.

I trust that this is of assistance.

Regards

█

Date 7 March 2018

Job No/Ref 254313-00

Planning application no. 17/05667/FUL

'NA2', Nairn, Transport Assessment

The purpose of this report is to respond to the various comments received from Transport Scotland (TS) with respect to the Transport Assessment (TA) which was submitted in support of the above planning application. TS's comments (Appendix A) have been amended to include a numbering system for ease of cross-referencing. Table 1 summarises the comments received from TS, with the Arup response provided opposite.

Table 1: Transport Scotland Comments and Arup Response

Ref	TS Comment (summarised)	Arup Response
1 (a)	Given that in excess of 90% of development generated traffic is anticipated to impact on the A96, Transport Scotland would have expected to have been consulted at the scoping stage.	<p>While it is correct that >90% of all development trips being generated by the 'NA2' site will pass through the A96(T)/Lochloy Road junction, the use of this value to justify consultation with TS is not in accordance with standard Scottish Government guidelines.</p> <p>Nonetheless, there are a number of additional reasons as to why TS were not consulted as part of the scoping process, namely:</p> <ul style="list-style-type: none"> a) The size, nature and remoteness of the development site from the A96(T)/Lochloy Road junction is such that any traffic impacts would be expected to be minimal. b) The criterion for assessing a junction relates to percentage impact, not absolute numbers (as inferred by TS). As outlined in Section 6.4.2 of the TA, this minimal traffic impact was subsequently demonstrated by undertaking a 'percentage impact analysis'. In accordance with the Scottish Government's Transport Assessment guidelines, values of <5% are considered acceptable with no need to undertake any further analysis on that section of the road network. In the case of the A96(T)/Lochloy Road junction, a maximum percentage impact of 3% on the A96 west approach, and 1% on the A96 east approach was demonstrated during the AM and PM peak periods. These results clearly demonstrate that the percentage contribution of traffic associated with the development proposals on the operation of the surrounding road network is limited. c) Given the above all efforts during the scoping exercise were focused on working with The Highland Council (THC) as the local Roads and Planning Authority.

Ref	TS Comment (summarised)	Arup Response
2 (a)	<p>We note that the anticipated vehicle trip generation has been estimated from vehicle trip rates extracted from the TRICS database and compared to observed vehicle trip rates derived from a survey of the Lochloy Road / Montgomerie Drive junction. The assessment has adopted the higher trip rates extracted from TRICS; 0.49 AM (0.17 arrivals and 0.32 departures) and 0.56 PM (0.33 arrivals and 0.23 departures) equating to 57 and 64 two-way vehicle trips during the AM and PM Peak hour periods respectively</p>	<p>Noted.</p> <p>It is also worth re-iterating the reason as to why the trip rates used within the TA were chosen. This is outlined below:</p> <ul style="list-style-type: none"> a) The methodology used to derive the trip rates within the TA was discussed with THC transport officers as part of a scoping exercise. Based upon the advice received from THC, Arup undertook a comparative trip rate review, where TRICS based data was compared to those derived from the observed 2017 traffic survey data. b) This comparative exercise ultimately found that in the majority of movements, the TRICS derived results actually produced a higher trip generation than the equivalent observed conditions. Despite the observed trip rates being a more accurate reflection of how the NA5 site is currently operating, and in the interests of ensuring a robust assessment, the TRICS-based trip generation was therefore selected for the purposes of the traffic modelling.
2 (b)	<p>Given that circa 75% of the units will be privately owned and circa 90% of these houses, the most appropriate residential sub-category in TRICS is "03/A – Houses Privately Owned (GDO use class C3)", not the individual sub-category approach adopted in the TA. As a consequence, the adopted trip rates would appear to be on the low side.....</p>	<p>Within TRICS, it is common to use sites which do not mirror the exact socio-demographic and geographical attributes of the locality surrounding a proposed development site.</p> <p>The recommendation that trips rates from the TRICS residential sub-category of '03/A – Houses Privately Owned (GDO use Class 3)' has not been fully explained by TS. A significant proportion of the site will consist of privately owned flats (8 units), affordable flats (8 units), and affordable houses (21 units). This amounts to a total of 37 units which do not fall under the 'Houses Privately Owned' category. It is therefore considered appropriate to account for these when defining trip rates.</p> <p>Furthermore, no TRICS output has been provided by TS to support their recommendation.</p> <p>Based on the above, the TRICS data used within the TA is deemed to be appropriate for use within the junction capacity modelling.</p> <p>Refer also to response no. 2 (a) for further information as to why the trip rates used within the TA are considered appropriate.</p>
2 (c)	<p>..... Notwithstanding this, it is recognised that had the TA adopted the trip rates previously accepted by THC for the NA5 Lochloy site, this would only result in an additional 15 vehicle trips on the Lochloy Road approach to the A96 / Lochloy Road / View Road traffic signal controlled junction over the AM Peak hour period. This increase is not considered to be significant in terms of detailed junction assessment nor would it change the overall conclusion of the TA. On</p>	<p>Noted.</p> <p>Refer also to response no. 2 (a) and 2 (b) which provide further information and justification as to why the trip rates used within the TA are considered appropriate.</p>

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 7 March 2018

Job No/Ref 254313-00

Ref	TS Comment (summarised)	Arup Response
	that basis, the vehicle trip rates and resultant vehicle trip generation is considered to be acceptable in this instance.	
3 (a)	Background traffic conditions on the A96 have been determined from a junction turning count survey undertaken at the A96 / Lochloy Road / View Road traffic signal controlled junction in April 2017. We are satisfied that April represents a neutral month therefore the survey is considered to be acceptable.	Noted.
4 (a)	The TA has included the NA5 Lochloy site as committed development. This site is understood to have consent for up to 685 residential units. Of this total, the TA states that only 87 units remain to be constructed and occupied. We have no basis upon which to dispute the number of remaining units however, The Highland Council (THC) has subsequently intimated that the number allowed for in the TA is reasonable. The trip generation for the remaining units has therefore been estimated by applying the vehicle trip rates adopted in the TA prepared in support of this site. This approach is considered to be acceptable.	Noted.
6 (a)	The TA has adopted a 2019 opening year of assessment. 2017 observed traffic flows have been factored to the aforementioned year of opening using growth factors determined from 'TEMPro'. While a 2019 opening year would appear optimistic, applying a further years growth to 2020 at a rate of around 2% is not considered to be significant in terms of detailed junction assessment. On that basis, the adopted opening year of assessment is considered to be acceptable in this instance.	Noted. Please also note that the use of a 2019 year of opening was based upon best available knowledge and information at the time of preparing the TA. An opening year of 2019 also allows for a period of up to two years for planning consent and RCC to be awarded, and construction to be completed.
7 (b)	From the traffic flow diagrams provided in the TA, the impact of development generated traffic on the A96 to the east and west of Lochloy Road is around 1% and 3% respectively. On that basis, detailed assessment of the trunk road network has been limited to the A96 / Lochloy Road / View Road traffic signal controlled junction only. This is considered to be acceptable in this instance.	Noted. Refer also to response no. 1 (a).
7 (b)	It is noted that the assessment of the A96 / Lochloy Road / View Road traffic signal controlled junction has been undertaken using LinSig and the model developed from the traffic signal specification provided by the	Noted.

Ref	TS Comment (summarised)	Arup Response
	Operating Company, BEAR Scotland. This approach is considered to be acceptable.	
7 (c)	<p>Notwithstanding this, the specification would appear to have been misinterpreted in terms of the modelled phase intergreen times. The traffic signals at this location are Puffin with on crossing detection, therefore the intergreen following the pedestrian Phase F is controlled by the CMX times. In summary, the max intergreen is 17 seconds. This is derived from page 8 of the specification which, for Phase F, indicates a 3s pedestrian clearance while page 16 indicates a 12s CMX clearance and 2s pedestrian demand hold. These timings generally relate to Periods 5, 6 and 9 in Table 2 (Nearside Period) of Traffic Advisory Leaflet (TAL) 5/05 Part 4 of 4. It is therefore incorrect to model a '0' intergreen from Phase F to the traffic phases in LinSig when, on site, the intergreen will range from an absolute minimum of 5s up to a maximum of 17s. It is recognised that the CMX clearance is demand dependant however, if pedestrian demand is not known, the modelling work should consider a 'worst case' scenario. We would therefore request that the model is re-run on that basis</p>	<p>In the interests of satisfying TS's concerns, the <i>LinSig</i> model of the A96(T)/Lochloy Road junction has been amended and re-run.</p> <p>The coding parameters have been revised in accordance with TS's comments, as follows:</p> <ul style="list-style-type: none"> a) An increased pedestrian intergreen in Stage 4 to 17 seconds. As suggested by TS, this is to reflect a 'worst case' as opposed to a more reasonable situation addressed in the TA. b) In Lane 2/2, the associated indicative arrow phase (phase C) has been associated with the main traffic phase (phase D). Refer also to response no. 7 (d). <p>Based upon the results of the re-run <i>LinSig</i> model (presented in Appendix C) it is considered that the modelling undertaken as part of the TA (and all subsequent sensitivity tests) is considered acceptable. This is based upon the following observations:</p> <p><u>Based on a 17 second Pedestrian Intergreen:</u></p> <ul style="list-style-type: none"> a) The initial results are based upon a 17 second pedestrian intergreen (as outlined in Appendix B). These indicate that compared to the Base scenario, the Total scenario adds only marginally to the level of queuing (an increase of 4 between the PM Base and PM Total being the greatest change). b) The CMX clearance is, as noted by TS, demand dependant. Assuming a 'worst case' scenario is being assessed, this would assume that the pedestrian stage is called every 90 seconds (the modelled cycle time), and every 90 seconds the intergreen operates at its <i>maximum</i> of 17 seconds. This is considered rather onerous. Including the 10 second pedestrian green time, this equates to a total pedestrian stage time of 27 seconds. It is considered such a scenario is highly unlikely to be called <i>every</i> cycle and consequently, the operational junction performance will be improved. c) Based upon the modelling parameters suggested by TS, it is acknowledged that the degree of saturation increases marginally above the 90% threshold on the A96(T) western approach arm in both the AM and PM scenarios. Specifically, the degree of saturation on this arm is 93.3% in the Total AM scenario and 94.6% on the Total PM scenario. However, as noted above, this is based upon an intergreen of 17 seconds being called every cycle, which is considered highly unlikely. <p><u>Based on a 12 second Pedestrian Intergreen:</u></p> <ul style="list-style-type: none"> d) As a means of determining a more 'realistic' operation of the pedestrian stage in terms of intergreen times, a further sensitivity test has been

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 7 March 2018

Job No/Ref 254313-00

Ref	TS Comment (summarised)	Arup Response
		<p>undertaken based upon applying a 12 second intergreen to the pedestrian stage. This value has been derived by calculating the 'standard error of the mean'. Taking such an approach reflects the level of variance from a defined sample size, in this case, the full range of potential intergreen times from a minimum of 5 seconds through to a maximum of 17 seconds (as confirmed by TS).</p> <p>Calculating the 'standard error of the mean' results in a value of 1.08 seconds. Applying this to the average intergreen time (i.e. 11 seconds) therefore assumes a value of 12 seconds which reflects an intergreen from the upper range of possible times. This is considered a more realistic interpretation of the likely pedestrian intergreen times.</p> <p>Based upon the above, and the results presented in Appendix B, it is considered that the A96(T)/Lochloy Road junction will continue to operate under capacity following the addition of trips associated with the NA2 development proposals.</p>
7 (d)	<p>In terms of which model, it is considered appropriate to use the model with Phase C coded as an Indicative Arrow (IA) phase. However, it is noted that when coding the Lane 2/2 details, the IA phase C has not been associated with the main traffic phase D resulting in Stage 2 indicating no minimum green time on the stage diagram. This should be amended when re-running the model.</p>	<p>The coding amendment suggested by TS has been incorporated into the revised <i>LinSig</i> model. Refer also to response no. 7 (c).</p>
7 (e)	<p>The reported results, which will change as a consequence of the above, currently indicate queues in excess of 100m on the A96 west approach in both the 'Base 2019' and 'Total 2019' traffic flow scenarios.....</p>	<p>The results and commentary of the amended <i>LinSig</i> modelling exercise are presented in response no. 7 (c) and Appendix B.</p>
7 (f)	<p>..... We would therefore seek clarification what steps have been taken to ensure that the predicted queuing in the base model is representative of actual conditions on the ground.</p>	<p>Refer to the <i>LinSig</i> results from the re-run model, along with associated commentary, as presented in response no. 7 (c) and Appendix B.</p>

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 7 March 2018

Job No/Ref 254313-00

Appendix A – Transport Scotland Comments (amended)

This Appendix contains the original comments received from TS via email on 27 February 2018, but amended to include a numbering system for ease of cross-referencing.

1) TA Scoping

- a) Given that in excess of 90% of development generated traffic is anticipated to impact on the A96, Transport Scotland would have expected to have been consulted at the scoping stage to minimise the risk of abortive work. It is noted that scoping discussions only involved The Highland Council (THC) as local roads authority.

2) Vehicle Trip Generation

- a) We note that the anticipated vehicle trip generation has been estimated from vehicle trip rates extracted from the TRICS database and compared to observed vehicle trip rates derived from a survey of the Lochloy Road / Montgomerie Drive junction. The assessment has adopted the higher trip rates extracted from TRICS; 0.49 AM (0.17 arrivals and 0.32 departures) and 0.56 PM (0.33 arrivals and 0.23 departures) equating to 57 and 64 two-way vehicle trips during the AM and PM Peak hour periods respectively.
- b) Given that circa 75% of the units will be privately owned and circa 90% of these houses, the most appropriate residential sub-category in TRICS is “03/A – Houses Privately Owned (GDO use class C3)”, not the individual sub-category approach adopted in the TA. As a consequence, the adopted trip rates would appear to be on the low side.....
- c) Notwithstanding this, it is recognised that had the TA adopted the trip rates previously accepted by THC for the NA5 Lochloy site, this would only result in an additional 15 vehicle trips on the Lochloy Road approach to the A96 / Lochloy Road / View Road traffic signal controlled junction over the AM Peak hour period. This increase is not considered to be significant in terms of detailed junction assessment nor would it change the overall conclusion of the TA. On that basis, the vehicle trip rates and resultant vehicle trip generation is considered to be acceptable in this instance.

3) Base Traffic

- a) Background traffic conditions on the A96 have been determined from a junction turning count survey undertaken at the A96 / Lochloy Road / View Road traffic signal controlled junction in April 2017. We are satisfied that April represents a neutral month therefore the survey is considered to be acceptable.

4) Committed Development

- a) The TA has included the NA5 Lochloy site as committed development. This site is understood to have consent for up to 685 residential units. Of this total, the TA states that only 87 units remain to be constructed and occupied. We have no basis upon which to dispute the number of remaining units however, The Highland Council (THC) has subsequently intimated that the number allowed for in the TA is reasonable. The trip generation for the remaining units has therefore been estimated by applying the vehicle trip rates adopted in the TA prepared in support of this site. This approach is considered to be acceptable.

5) Assessment Year

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 7 March 2018

Job No/Ref 254313-00

- a) The TA has adopted a 2019 opening year of assessment. 2017 observed traffic flows have been factored to the aforementioned year of opening using growth factors determined from 'TEMPro'. While a 2019 opening year would appear optimistic, applying a further years growth to 2020 at a rate of around 2% is not considered to be significant in terms of detailed junction assessment. On that basis, the adopted opening year of assessment is considered to be acceptable in this instance.

6) Junction Assessment

- a) From the traffic flow diagrams provided in the TA, the impact of development generated traffic on the A96 to the east and west of Lochloy Road is around 1% and 3% respectively. On that basis, detailed assessment of the trunk road network has been limited to the A96 / Lochloy Road / View Road traffic signal controlled junction only. This is considered to be acceptable in this instance.
- b) It is noted that the assessment of the A96 / Lochloy Road / View Road traffic signal controlled junction has been undertaken using LinSig and the model developed from the traffic signal specification provided by the Operating Company, BEAR Scotland. This approach is considered to be acceptable.
- c) Notwithstanding this, the specification would appear to have been misinterpreted in terms of the modelled phase intergreen times. The traffic signals at this location are Puffin with on crossing detection, therefore the intergreen following the pedestrian Phase F is controlled by the CMX times. In summary, the max intergreen is 17 seconds. This is derived from page 8 of the specification which, for Phase F, indicates a 3s pedestrian clearance while page 16 indicates a 12s CMX clearance and 2s pedestrian demand hold. These timings generally relate to Periods 5, 6 and 9 in Table 2 (Nearside Period) of Traffic Advisory Leaflet (TAL) 5/05 Part 4 of 4. It is therefore incorrect to model a '0' intergreen from Phase F to the traffic phases in LinSig when, on site, the intergreen will range from an absolute minimum of 5s up to a maximum of 17s. It is recognised that the CMX clearance is demand dependant however, if pedestrian demand is not known, the modelling work should consider a 'worst case' scenario. We would therefore request that the model is re-run on that basis.
- d) In terms of which model, it is considered appropriate to use the model with Phase C coded as an Indicative Arrow (IA) phase. However, it is noted that when coding the Lane 2/2 details, the IA phase C has not been associated with the main traffic phase D resulting in Stage 2 indicating no minimum green time on the stage diagram. This should be amended when re-running the model.
- e) The reported results, which will change as a consequence of the above, currently indicate queues in excess of 100m on the A96 west approach in both the 'Base 2019' and 'Total 2019' traffic flow scenarios.....
- f) We would therefore seek clarification what steps have been taken to ensure that the predicted queuing in the base model is representative of actual conditions on the ground.

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 7 March 2018

Job No/Ref 254313-00

Appendix B – *LinSig* Outputs and Commentary

The data presented in this Appendix includes a summary the *LinSig* modelling results from the revised model which now incorporates the modelling parameters suggested by TS. Refer to response no. 7 (c) for further details of this test. Refer also to Appendix C for the full set of *LinSig* model outputs.

Table B.1 summarises the original junction analysis results for the 2019 AM and PM scenarios, as presented in section 6.4.5 of the TA. Table B.2 provides the equivalent information but based upon the results from the re-run models which incorporate a 17 second intergreen. Finally, Table B.3 summarises the results based on a 12 second pedestrian intergreen.

Table B.1: Lochloy Road / A96(T) – Peak Period Capacity Results (AM & PM) – Original Results

Approach Arm	Base 2019 (AM)		Base 2019 (PM)		Total 2019 (AM)		Total 2019 (PM)	
	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q
Lochloy Road – left, ahead & right	77.9%	9	70.9%	5	79.3%	10	75.2%	5
A96(T)(E) - right, left, ahead	64.2%	12	60.9%	11	67.4%	13	63.0%	12
View Road – ahead, right, left	4.7%	0	7.8%	0	4.3%	0	7.1%	0
A96(T)(W) – left, ahead, right	67.0%	13	70.1%	15	71.4%	15	73.4%	16

Table B.2: Lochloy Road / A96(T) – Peak Period Capacity Results (AM & PM) – Re-run Models (with 17 second intergreen)

Approach Arm	Base 2019 (AM)		Base 2019 (PM)		Total 2019 (AM)		Total 2019 (PM)	
	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q
Lochloy Road – left, ahead & right	90.1%	11	84.2%	6	95.0%	14	88.1%	7
A96(T)(E) - right, left, ahead	85.0%	18	78.0%	17	87.9%	19	82.5%	18
View Road – ahead, right, left	5.4%	0	9.5%	0	5.2%	0	8.5%	0
A96(T)(W) – left, ahead, right	88.8%	20	89.9%	24	93.3%	23	94.6%	28

It is important to note that, based on a 17 second pedestrian intergreen, the Lochloy Road approach arm shows a degree of saturation of 90.1% under the Base scenario (i.e. without the addition of development related trips).

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 7 March 2018

Job No/Ref 254313-00

Table B.3: Lochloy Road / A96(T) – Peak Period Capacity Results (AM & PM) – Re-run Models (with 12 second intergreen)

Approach Arm	Base 2019 (AM)		Base 2019 (PM)		Total 2019 (AM)		Total 2019 (PM)	
	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q
Lochloy Road – left, ahead & right	81.6%	9	77.0%	5	86.4%	11	81.1%	6
A96(T)(E) - right, left, ahead	78.7%	16	71.8%	15	81.2%	16	74.4%	16
View Road – ahead, right, left	4.9%	0	8.5%	0	4.7%	0	7.8%	0
A96(T)(W) – left, ahead, right	82.1%	17	82.7%	20	86.1%	19	86.9%	22

As shown above, the A96(T)/Lochloy Road junction operates within capacity under the original modelling exercise as presented within the TA, but also under the latest set of model re-runs which are based on the application of a 12 second pedestrian intergreen.

Job No/Ref 254313-00

Appendix C – *LinSig* Model Outputs (full)

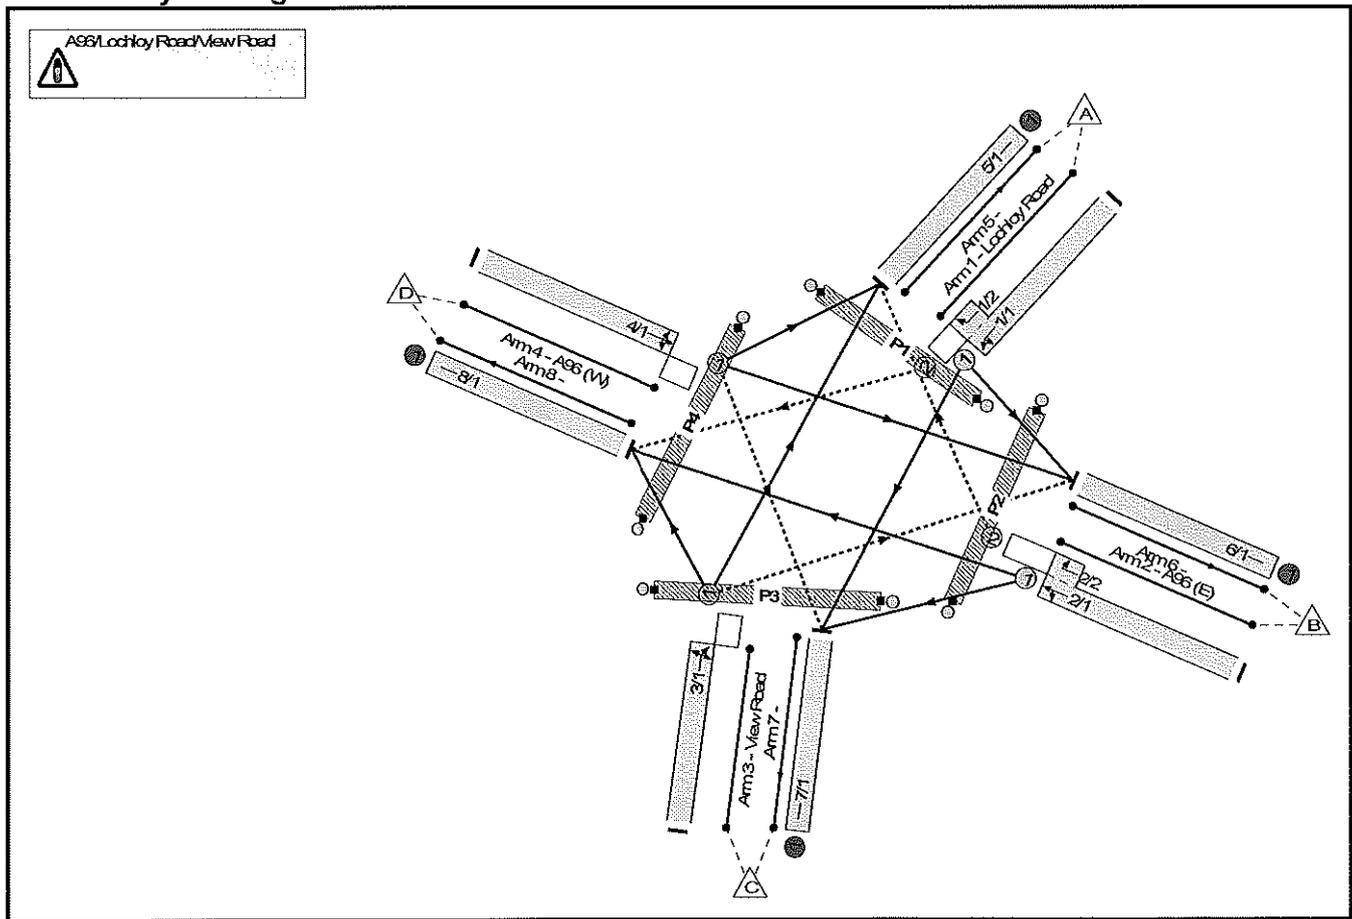

The data presented in this Appendix includes the full set of *LinSig* modelling results output from the revised model which now incorporates the modelling parameters suggested by TS (including a 17 second pedestrian intergreen), along with a further sensitivity test based on a 12 second pedestrian intergreen. A summary of the results have been tabulated and are presented in Appendix B.

Hi [REDACTED]

Apologies, I'm currently out of the office. I understand you've been trying to get hold of me with regards obtaining the raw model files relating to our response which was issued yesterday (see below). Please find attached the requested files. This includes:

- The LinSig model updated to include Transport Scotland's suggested coding amendments; and
- The LinSig model with a pedestrian intergreen of 12 seconds.

I trust this will allow you to complete your review and provide your comments to Highland Council. As you'll know, Springfield are looking at a committee date to be finalised by the end of March.

Should you have any queries, please let me know.

Regards,
[REDACTED]

[REDACTED]

Many thanks for your email.

In response to your query, the 'dedicated right-turn' facility you refer to (run under Stage 2) has not been enabled due to the low level of demand for right turners. Right turners would be able to make the movement within Stage 2 either within gaps in oncoming vehicles or in the intergreen and thus without recourse the calling of the dedicated right turn arrow. Having this stage being called every cycle would also impose a level of inefficiency on the operation of the junction. The level of demand making the right turn movement (i.e. in the Total scenario, this equates to 41 PCUs in the AM peak period and 108 PCUs in the PM peak period) was found to be sufficiently low and, in the interests of maximising the operational capacity of the junction, the dedicated right-turn under Stage 2 has not been enabled. However, the stage was still coded as part of the model to allow us to undertake various assessment scenarios as part of the overall TA process.

I trust this answers your query. However, if you have any further queries, please don't hesitate to let me know.

Regards,
[REDACTED]

[REDACTED]

To assist with our review of the amended LinSig runs / output, it would be appreciated if you could clarify the stage sequence that you are seeking to replicate. The model output that you have provided indicates a stage sequence comprising 4 stages as per the specification however, the IA phase (i.e. Stage 2) would not appear to have been enabled in the 'Stages View'. As a consequence, the model is not running / allocating any time to Stage 2 as evident from the 'Signal Timings Diagram'. If enabled, the 'Stage Diagram' and 'Stage Sequence Diagrams' would indicate a minimum $\geq 4s$ rather than '0'.

Further clarification in relation to the above would be appreciated however, please do not hesitate to contact me should you wish to discuss.

Regards

Many thanks for your email.

We've taken into account your suggested coding revisions and re-run the *LinSig* model for both the Base and Total scenarios. The results from this latest round of testing shows that the junction operates within capacity in all scenarios. This mirrors the findings outlined in the original TA. Please see attached a short briefing paper which summarises this latest modelling assessment, along with the tabulated results and LinSig outputs.

I trust this will now allow you to provide your formal response to Highland Council. Should you have any queries, please don't hesitate to let myself or Gordon know.

Regards,

[REDACTED]

Further to the recent correspondence below, we have now had the opportunity to review the IA and pedestrian demand data provided by BEAR. Based on the aforementioned data, we would request that to you run your model with the following changes for both the base and base plus development scenarios.

- A pedestrian intergreen of 17s;
- The IA phase (i.e. Stage 2) and pedestrian phase (i.e. Stage 4) called every second cycle.

Receipt of the above will conclude the requirements of Transport Scotland in relation to the assessment of the A96 / Lochloy Road traffic signal controlled junction. In the meantime, please do not hesitate to contact me should you have any queries.

Hi [REDACTED]

Thanks. In this case I think it would be sensible and to avoid further delays given there is still a review and response period for Springfield to commission the survey work via ARUP as previously discussed which I believe will gather the Data you're seeking?

Kind regards

Transport Scotland is continuing to liaise with the Operating Company regarding receipt of this data however until received, it is difficult to provide a firm indication of timescales. Notwithstanding this, we are hopeful that the data will be provided for review early next week.

We trust the above is of assistance and we will seek to provide you with a further update on progress once the data is received.

Further to your email below and our subsequent telephone conversation, Transport Scotland has been advised that data relating to the frequency of the IA phase and pedestrian stage can be remotely accessed. As discussed, Transport Scotland has requested this data to allow a more informed decision on the A96 / Lochloy Road scenario testing to be taken.

The receipt of the above data may negate the need to undertake the surveys set out in your email below however, it is recognised that you may wish to undertake your own data collection exercise which we would consider to be a matter for you and your client.

As also discussed, Transport Scotland will not in a position to issue a formal response on this planning application until this data has been received and reviewed.

I trust the above is a fair reflection of our recent telephone conversation however, please do not hesitate to contact me should you have any further queries.

Regards

[REDACTED]

Further to our discussion yesterday relating to the above planning application in Nairn, I have received an instruction from my client to organise a new survey of the A96(T) / Lochloy Road junction focusing on the two areas of interest to Transport Scotland, namely

- The frequency the right turn indicative arrow from the trunk road to Lochloy Road is called during the modelled morning and evening peak periods.
- Similarly, pedestrian activity at the junction including again the frequency the pedestrian stage is called within the modelled periods. For instance is the pedestrian facility called every cycle or is it less frequent and also how long the facility runs for within a cycle? We would also intend to record the number of pedestrians crossing at the junction.

It is intended that the survey will be undertaken as soon as practical after the schools return following the Easter holidays. The results of the survey would be collated in a summary document.

In order to expedite matters and as we are committed to undertaking this survey to provide the additional comfort sought by Transport Scotland, I would be grateful if you would now submit your formal response on the application, along with any appropriate caveats relating to this additional survey which you consider appropriate.

Can you confirm that you are happy with this suggestion and would now be willing to submit your formal response on the application.

Many thanks

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 17 April 2018

Job No/Ref 254313-00

Introduction

Planning application no. 17/05667/FUL

'NA2', Nairn, Transport Assessment

The purpose of this note is to respond to the latest set of comments received from Transport Scotland (TS) on 17/04/18 with respect to the Transport Assessment (TA) which was submitted in support of the above planning application.

The overall findings and content of the original TA remain correct and unchanged.

Background

In their emails of 15/03/18 and 19/03/18, TS requested clarification on the stage sequencing and timings being assessed as part of the *LinSig* model for the A96(T)/Lochloy Road signalised junction. A number of sensitivity tests were subsequently undertaken, with the results from this exercise presented in a briefing note which was issued to TS on 21/03/18 (file reference: Transport Scotland Response 21-03-2018, NA2 Transport Assessment, Nairn, pdf).

The most recent set of comments received from TS on 17/04/18 have requested that specific modelling parameters relating to staging should be incorporated into the *LinSig* model. Details of this are outlined below, with all model outputs being presented in Appendix A.

LinSig Modelling Results

The latest request from TS is as follows:

"... ..we would request that to you run your model with the following changes for both the base and base plus development scenarios.

- *A pedestrian intergreen of 17s; and*
- *The IA phase (i.e. Stage 2) and pedestrian phase (i.e. Stage 4) called every second cycle".*

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 17 April 2018

Job No/Ref 254313-00

The revised staging is illustrated in **Figure 1**.

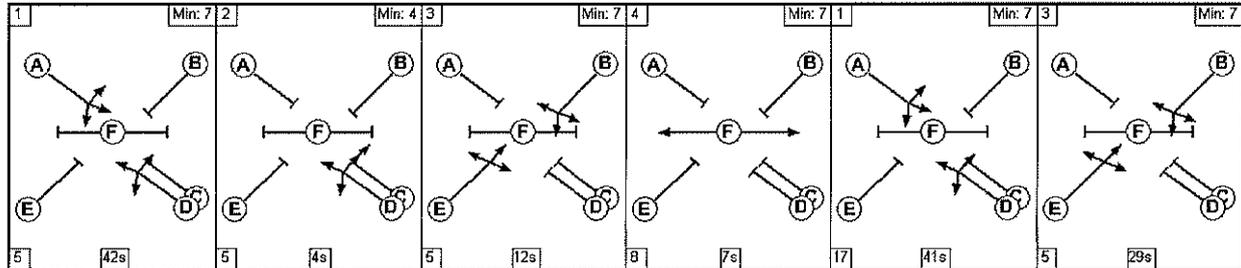

Figure 1: Stage sequencing and double cycle

Table 1 summarises the junction capacity results as outlined in the original TA. **Table 2** provides the same, but based upon the revised coding parameters in accordance with the latest TS request.

Table 1: Lochloy Road / A96(T) – Peak Period Capacity Results (AM & PM) – Original TA

Approach Arm	Base 2019 (AM)		Base 2019 (PM)		Total 2019 (AM)		Total 2019 (PM)	
	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q
Lochloy Road – left, ahead & right	77.9%	9	70.9%	5	79.3%	10	75.2%	5
A96(T)(E) - right, left, ahead	64.2%	12	60.9%	11	67.4%	13	63.0%	12
View Road – ahead, right, left	4.7%	0	7.8%	0	4.3%	0	7.1%	0
A96(T)(W) – left, ahead, right	67.0%	13	70.1%	15	71.4%	15	73.4%	16

Table 2: Lochloy Road / A96(T) – Peak Period Capacity Results (AM & PM) – TS Request 17/04/18

Approach Arm	Base 2019 (AM)		Base 2019 (PM)		Total 2019 (AM)		Total 2019 (PM)	
	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q
Lochloy Road – left, ahead & right	76.2%	9.6	77.0%	5.1	80.9%	11.0	78.0%	6.1
A96(T)(E) - right, left, ahead	67.0%	14.4	61.4%	15.4	68.8%	15.3	64.1%	15.7
View Road – ahead, right, left	4.6%	0.4	8.5%	0.4	4.4%	0.4	7.4%	0.4
A96(T)(W) – left, ahead, right	77.3%	18.9	76.6%	24.9	80.9%	20.6	81.1%	26.5

Key parameters: Stage 2 (the dedicated right turn arrow) is 'double cycled'. The pedestrian stage, which has a 17 second intergreen, is also 'double cycled'.

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 17 April 2018

Job No/Ref 254313-00

Conclusions and Recommendation

The results from this assessment indicate that the A96(T)/Lochloy Road signalised junction will continue to operate within capacity following the introduction of traffic associated with the proposed housing development on the 'NA2' site in Nairn. Furthermore, it is recommended that no mitigation as a direct result of the 'NA2' development proposals is required.

The overall findings and content of the original TA remain correct and unchanged. The work presented within this paper and all previous papers reflect a series of sensitivity tests which have been undertaken to address the concerns raised by TS (and BEAR).

Importance: High

Good afternoon [REDACTED]

Following our earlier conversations and email correspondence, please find attached a briefing paper which summarises the results from a series of minor sensitivity tests for the A96(T) / Lochloy Road signalised junction. These tests have been undertaken to address the latest set of comments received from Transport Scotland (see below). The overall findings and conclusions of the original Transport Assessment remain unchanged.

To date, we have addressed all comments received from TS (and BEAR) and trust that the attached will now allow you to finalise your response to Highland Council with respect to the planning application for the 'NA2' site.

Should you have any queries, please let me know.

Regards,
[REDACTED]

Subject: RE: Planning Application 17/05667/FUL

[REDACTED]

Further to our earlier telephone conversation, I have had further discussions with BEAR and would advise that the views expressed in relation to pedestrian demand and the IA phase are based on their knowledge of the operation of this junction and observations made on site. On that basis, it is considered appropriate to model a 'worst case' scenario as a starting point in seeking to demonstrate that the traffic signals can accommodate the anticipated increase in traffic. It is incumbent on the developer through their own site observations or data collection exercise to justify the adoption of an alternative scenario.

I trust the above provides additional clarification however, please do not hesitate to contact me should you wish to discuss this further.

Regards

Subject: RE: Planning Application 17/05667/FUL

[REDACTED]

Many thanks for your email.

In response to your query, the 'dedicated right-turn' facility you refer to (run under Stage 2) has not been enabled due to the low level of demand for right turners. Right turners would be able to make the movement within Stage 2 either within gaps in oncoming vehicles or in the intergreen and thus without recourse the calling of the dedicated right turn arrow. Having this stage being called every cycle would also impose a level of inefficiency on the operation of the junction. The level of demand making the right turn movement (i.e. in the Total scenario, this equates to 41 PCUs in the AM peak period and 108 PCUs in the PM peak period) was found to be sufficiently low and, in the interests of maximising the operational capacity of the junction, the dedicated right-turn under Stage 2 has not been enabled. However, the stage was still coded as part of the model to allow us to undertake various assessment scenarios as part of the overall TA process.

I trust this answers your query. However, if you have any further queries, please don't hesitate to let me know.

Regards,
[REDACTED]

Subject: RE: Planning Application 17/05667/FUL

[REDACTED]

To assist with our review of the amended LinSig runs / output, it would be appreciated if you could clarify the stage sequence that you are seeking to replicate. The model output that you have provided indicates a stage sequence comprising 4 stages as per the specification however, the IA phase (i.e. Stage 2) would not appear to have been enabled in the 'Stages View'. As a consequence, the model is not running / allocating any time to Stage 2 as evident from the 'Signal Timings Diagram'. If enabled, the 'Stage Diagram' and 'Stage Sequence Diagrams' would indicate a minimum $\geq 4s$ rather than '0'.

Further clarification in relation to the above would be appreciated however, please do not hesitate to contact me should you wish to discuss.

Regards

Introduction

Planning application no. 17/05667/FUL

‘NA2’, Nairn, Transport Assessment

The purpose of this note is to respond to comments received from Transport Scotland (TS) with respect to the Transport Assessment (TA) which was submitted in support of the above planning application. The overall findings and content of the original TA remain correct and unchanged.

Background

In their email of 15/03/18, TS requested clarification on the stage sequence being assessed as part of the *LinSig* model for the A96(T) / Lochloy Road signalised junction. It was requested that ‘stage 2’, which allows for a dedicated right-turn indicative arrow, is enabled every cycle.

Furthermore, TS noted in their email of 19/03/18 that following discussions with the trunk road operating company (BEAR), a ‘worst case’ scenario should be assessed. This assessment exercise is outlined below.

LinSig Modelling Results

A set of sensitivity tests were undertaken using the various modelling parameters summarised in Table 1. The model outputs from these sensitivity tests are presented in Appendix A.

Table 1: Sensitivity Tests and Modelling Parameters

Scenario Ref	Cycle Time (seconds)	Stage Sequence	Stage 2 min time (indicative right turn arrow, seconds)	Stage 4 Ped Intergreen (seconds)	Table Ref
Original TA	90	1, 2, 3, 4	0	5	2
A	90	1, 2, 3, 4	0	12	3
B	90	1, 2, 3, 4	0	17	4
C	90	1, 2, 3, 4	4	12	5
D (‘worst case’)	90	1, 2, 3, 4	4	17	6
E	180 (double cycled)	1, 2, 3, 4, 1, 3, 4 (double cycled)	4	12	7

A96(T)(W) – left, ahead, right	106.0%	45	108.8%	64	111.9%	62	112.0%	77

Key parameters: Stage 2 (the dedicated right turn arrow) is run every cycle. The pedestrian stage has a 17 second intergreen.

Table 6: Lochloy Road / A96(T) – Peak Period Capacity Results (AM & PM) – Scenario E

Approach Arm	Base 2019 (AM)		Base 2019 (PM)		Total 2019 (AM)		Total 2019 (PM)	
	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q	Deg Sat	Mean Max Q
Lochloy Road – left, ahead & right	95.1%	13	92.9%	8	92.7%	13	92.0%	8
A96(T)(E) - right, left, ahead	73.2%	15	69.1%	14	78.2%	16	72.2%	16
View Road – ahead, right, left	5.8%	0	10.7%	0	5.0%	0	9.0%	0
A96(T)(W) – left, ahead, right	96.6%	25	96.2%	29	93.3%	23	92.5%	28

Key parameters: Under the Total scenario, stage 2 (the dedicated right turn arrow) is double-cycled. In the Base scenario, stage 2 is called every cycle in accordance with the current signal specification and as request by TS/BEAR. The pedestrian stage has a 12 second intergreen in both scenarios.

LinSig optimises the cycle time and green time for each phase/stage.

Discussion and Key Issues

Key Issues

There are three main issues that need to be taken into consideration when reviewing the above results, namely:

- Whether or not the dedicated tight-turn facility in stage 2 is enabled/required every cycle;
- The appropriate length of the pedestrian intergreen in stage 4; and
- The likelihood of the ‘worst case’ scenario occurring every cycle.

Right-turn Arrow (Stage 2)

Under Scenario A and Scenario B, the ‘right-turn’ facility in stage 2 has not been enabled due to the low level of demand for right turners. In other words, any vehicles making this movement would be able to do so either within gaps on oncoming vehicles or in the intergreen and thus without recourse the calling of the dedicated right turn arrow. (The TA provides full details of all traffic demands, including the 2017 observed survey counts).

Furthermore, having stage 2 being called every cycle would impose a level of inefficiency on the operation of the junction. In the interests of maximising the junction’s operational performance, and taking into consideration that the dedicated right-turn facility is demand dependant, stage 2 has not been enabled in the first two scenarios.

Pedestrian Intergreen (Stage 4)

The CMX clearance/pedestrian intergreen is, as noted by TS, demand dependant. Assuming a ‘worst case’ scenario, the pedestrian stage is called every 90 seconds (the modelled cycle time), and every 90 seconds the intergreen operates at its maximum of 17 seconds. This is considered rather onerous. Including the 10 second pedestrian green time, this equates to a total pedestrian stage time of 27 seconds. It is considered that such a scenario is highly unlikely to be called every cycle and consequently, if the intergreen was reduced to a more realistic and representative value, the operational performance of the junction can be improved significantly.

Refer also to the discussion below.

‘Worst Case’ Scenario

A ‘worst case’ scenario consists of the right-turn arrow (stage 2) being called every cycle and the pedestrian stage (stage 4) having an intergreen of 17 seconds. Importantly, both stage 2 and stage 4 are demand dependant, as confirmed by TS. Running both stages every cycle reflects a scenario which is unlikely to occur and which is not considered a reasoned or realistic approach to understanding how this junction is likely to operate following the introduction of development related trips to the network. Furthermore, no quantitative information or data to support the request from TS/BEAR that a ‘worst case’ scenario should be considered as part of the planning application was made available.

As outlined in the TA, the highest number of development related trips making the right-turn from the A96 (east arm) onto Lochloy Road can be found during the PM peak period. Here, a total of 12 additional PCUs have been identified. This equates to approximately 1 vehicle every 5 minutes.

Subject NA2, Nairn, Transport Assessment (Response to Transport Scotland)

Date 21 March 2018

Job No/Ref 254313-00

Having the stage 2 right-turn arrow called every 90 seconds is therefore not considered to be representative of a demand dependant facility.

Conclusions and Recommendation

In conclusion:

- The ‘worst case’ scenario requested by TS/BEAR is unlikely to occur on a continual basis throughout the AM and PM peak periods. This is evidenced within the TA where it has been shown that there are only 12 additional development-related trips making the right turn onto Lochloy Road during the PM peak period. This equates to *circa* 1 vehicle every 300 seconds, compared to a cycle time of 90 seconds;
- Introducing any form of mitigation at this junction to account for the introduction of 12 development related trips is not considered to be appropriate justification for the introduction of any mitigation, nor a positive example of ‘value engineering’; and
- Scenario E shows that junction performance can be improved significantly through the double-cycling of stage 2 such that the results from the Total scenario (i.e. with development) mirror very closely the results from the equivalent Base scenario. This suggests that the junction will continue to operate effectively following the addition of the development related trips.

Based upon the above, it is recommended that no mitigation as a direct result of the ‘NA2’ development proposals is required. However, Scenario E could be implemented by TS/BEAR if considered appropriate.

Finally, the overall findings and content of the original TA remain correct and unchanged. The work presented within this paper reflect a series of simple sensitivity tests which have been undertaken to address the latest comments received from TS (and BEAR).

Subject: Planning Application 17/05667/FUL

[REDACTED]

Further to our discussion yesterday relating to the above planning application in Nairn, I have received an instruction from my client to organise a new survey of the A96(T) / Lochloy Road junction focusing on the two areas of interest to Transport Scotland, namely

- The frequency the right turn indicative arrow from the trunk road to Lochloy Road is called during the modelled morning and evening peak periods.
- Similarly, pedestrian activity at the junction including again the frequency the pedestrian stage is called within the modelled periods. For instance is the pedestrian facility called every cycle or is it less frequent and also how long the facility runs for within a cycle? We would also intend to record the number of pedestrians crossing at the junction.

It is intended that the survey will be undertaken as soon as practical after the schools return following the Easter holidays. The results of the survey would be collated in a summary document.

In order to expedite matters and as we are committed to undertaking this survey to provide the additional comfort sought by Transport Scotland, I would be grateful if you would now submit your formal response on the application, along with any appropriate caveats relating to this additional survey which you consider appropriate.

Can you confirm that you are happy with this suggestion and would now be willing to submit your formal response on the application.

Many thanks

Subject: RE: NA2, Nairn, Transport Assessment - LinSig modelling files

[REDACTED]

Thank you for providing the modelling files. Having now had the opportunity to review these and the Transport Assessment (TA), we would offer the following comments.

TA Scoping

Given that in excess of 90% of development generated traffic is anticipated to impact on the A96, Transport Scotland would have expected to have been consulted at the scoping stage to minimise the risk of abortive work. It is noted that scoping discussions only involved The Highland Council (THC) as local roads authority.

Vehicle Trip Generation

We note that the anticipated vehicle trip generation has been estimated from vehicle trip rates extracted from the TRICS database and compared to observed vehicle trip rates derived from a survey of the Lochloy Road / Montgomerie Drive junction. The assessment has adopted the higher trip rates extracted from TRICS; 0.49 AM (0.17 arrivals and 0.32 departures) and 0.56 PM (0.33 arrivals and 0.23 departures) equating to 57 and 64 two-way vehicle trips during the AM and PM Peak hour periods respectively.

Given that circa 75% of the units will be privately owned and circa 90% of these houses, the most appropriate residential sub-category in TRICS is "03/A – Houses Privately Owned (GDO use class C3)", not the individual sub-category approach adopted in the TA. As a consequence, the adopted trip rates would appear to be on the low side. Notwithstanding this, it is recognised that had the TA adopted the trip rates previously accepted by THC for the NA5 Lochloy site, this would only result in an additional 15 vehicle trips on the Lochloy Road approach to the A96 / Lochloy Road / View Road traffic signal controlled junction over the AM Peak hour period. This increase is not considered to be significant in terms of detailed junction assessment nor would it change the overall conclusion of the TA. On that basis, the vehicle trip rates and resultant vehicle trip generation is considered to be acceptable in this instance.

Base Traffic

Background traffic conditions on the A96 have been determined from a junction turning count survey undertaken at the A96 / Lochloy Road / View Road traffic signal controlled junction in April 2017. We are satisfied that April represents a neutral month therefore the survey is considered to be acceptable.

Committed Development

The TA has included the NA5 Lochloy site as committed development. This site is understood to have consent for up to 685 residential units. Of this total, the TA states that only 87 units remain to be constructed and occupied. We have no basis upon which to dispute the number of remaining units however, The Highland Council (THC) has subsequently intimated that the number allowed

for in the TA is reasonable. The trip generation for the remaining units has therefore been estimated by applying the vehicle trip rates adopted in the TA prepared in support of this site. This approach is considered to be acceptable.

Assessment Year

The TA has adopted a 2019 opening year of assessment. 2017 observed traffic flows have been factored to the aforementioned year of opening using growth factors determined from 'TEMPro'. While a 2019 opening year would appear optimistic, applying a further years growth to 2020 at a rate of around 2% is not considered to be significant in terms of detailed junction assessment. On that basis, the adopted opening year of assessment is considered to be acceptable in this instance.

Junction Assessment

From the traffic flow diagrams provided in the TA, the impact of development generated traffic on the A96 to the east and west of Lochloy Road is around 1% and 3% respectively. On that basis, detailed assessment of the trunk road network has been limited to the A96 / Lochloy Road / View Road traffic signal controlled junction only. This is considered to be acceptable in this instance.

It is noted that the assessment of the A96 / Lochloy Road / View Road traffic signal controlled junction has been undertaken using LinSig and the model developed from the traffic signal specification provided by the Operating Company, BEAR Scotland. This approach is considered to be acceptable.

Notwithstanding this, the specification would appear to have been misinterpreted in terms of the modelled phase intergreen times. The traffic signals at this location are Puffin with on crossing detection, therefore the intergreen following the pedestrian Phase F is controlled by the CMX times. In summary, the max intergreen is 17 seconds. This is derived from page 8 of the specification which, for Phase F, indicates a 3s pedestrian clearance while page 16 indicates a 12s CMX clearance and 2s pedestrian demand hold. These timings generally relate to Periods 5, 6 and 9 in Table 2 (Nearside Period) of Traffic Advisory Leaflet (TAL) 5/05 Part 4 of 4. It is therefore incorrect to model a '0' intergreen from Phase F to the traffic phases in LinSig when, on site, the intergreen will range from an absolute minimum of 5s up to a maximum of 17s. It is recognised that the CMX clearance is demand dependant however, if pedestrian demand is not known, the modelling work should consider a 'worst case' scenario. We would therefore request that the model is re-run on that basis.

In terms of which model, it is considered appropriate to use the model with Phase C coded as an Indicative Arrow (IA) phase. However, it is noted that when coding the Lane 2/2 details, the IA phase C has not been associated with the main traffic phase D resulting in Stage 2 indicating no minimum green time on the stage diagram. This should be amended when re-running the model.

The reported results, which will change as a consequence of the above, currently indicate queues in excess of 100m on the A96 west approach in both the 'Base 2019' and 'Total 2019' traffic flow scenarios. We would therefore seek clarification what steps have been taken to ensure that the predicted queuing in the base model is representative of actual conditions on the ground.

We trust that you will seek to address the above comments where an action is required however, in the meantime, please do not hesitate to contact me should you have any queries.

Subject: NA2, Nairn, Transport Assessment - LinSig modelling files

Many thanks for your phone call.

As requested, please find attached a copy of the LinSig models which were used as part of the Nairn (NA2) Transport Assessment. The first model reflects the one which was used to inform the TA. The second model (titled 'sensitivity test') reflects a minor coding amendment which connects the RT movement from the A96 into Lochloy Road to an associated phase. All other coding remains the same and, as you'll see, this has had a negligible impact on the results.

Please note, we are currently reviewing all of the Council's comments regarding the TA to help ensure that all of their concerns are suitably addressed.

Also attached is a copy of the signal spec which was used to inform the signal modelling.

If you have any further queries, please don't hesitate to let me know.

Regards,

Hi [REDACTED]

Apologies for delay, there was an issue with the RMS config for this site which we have now fixed.

I've attached the assessment log which will allow you to review how many times the RTIA and pedestrian stage have run in a given period.

Regards,

[REDACTED]

[REDACTED]

I appreciate that you are busy however, obtaining this data has now become critical. We are under pressure to respond on the planning application and have already missed one committee date. It would therefore be appreciated if you could chase Siemens for the data.

Thanks

Subject: RE: A96 / Lochloy Signal IA / Pedestrian Data

[REDACTED]

Your interpretation of the data looks sound to me. The data shows the ped stage running for 10 seconds as this was the length of the ped stage when the pedestrian facilities were farsided. When the site was updated to nearsided the ped min was reduced to 7 seconds from 10. Technically the MOVA dataset should have been updated to allow for the reduced ped length. Unfortunately the controller does not record the actual intergreens that ran, therefore when modeling in LinSig I would probably just use the maximum possible value.

Cc: [REDACTED]@transport.gov.scot
Subject: RE: A96 / Lochloy Signal IA / Pedestrian Data

[REDACTED]

Further to our recent telephone conversation, please find attached a spreadsheet summarising the AM and PM IA and pedestrian demand; 'Peak Hour Summary' tab. As discussed, it would be appreciated if you could give it a very quick spot check to ensure I have not misinterpreted the raw data.

It would appear to indicate that the IA phase is called once every 4 cycles max and once every 8 cycles on average during the AM peak with the pedestrian phase called once every 2 cycles max and once every 3 cycles on average during the equivalent period.

During the PM peak, the data would appear to indicate that the IA phase is called once every 3 cycles max and once every 4 cycles on average with the pedestrian phase called once every 2 cycles max and once every 3 cycles on average during the equivalent period.

The modelling undertaken to date has assumed a pedestrian intergreen of 12s and the maximum of 17s. This is in addition to the minimum green of 7s modelled for the pedestrian phase. The data indicates a max duration for the pedestrian phase of 10s during both peak periods. Does the 10s relate to the CMX timings therefore it would be acceptable to model a 10s intergreen in addition to the 7s min green or is this the overall time given to the pedestrian phase inclusive of the min green (i.e. you would model a 7s min green and a 3s intergreen)?

Happy to discuss.

Regards

Subject: RE: A96 / Lochloy Rd Traffic Signals - Nairn

Hi [REDACTED]

Apologies for the delay in coming back to you.

The existing traffic signals at this location are PUFFIN with on crossing detection, therefore the inter-green is controlled by the CMX times.

In summary, the max inter-green is 17 seconds, and I have added screenshots from the specification together with explanation to allow you to see where this derived from.

Page 8 of specification for Phase F indicates 3 second pedestrian clearance

Phase Minimums, Maximums, Extensions, Ped Leaving Periods											
Phase	Min Gree	Min Ped C	Extensio	Maximums							
				A	B	C	D	E	F	G	H
A	7	0	1.6	20	49	30	71	40	40	40	40
B	7	0	1.6	20	33	15	11	40	40	40	40
C	4	0	1.6	10	10	10	20	40	40	40	40
D	7	0	1.6	20	49	30	71	40	40	40	40
E	7	0	1.6	20	33	15	11	40	40	40	40
F	7	3	0.0	0	0	0	0	0	0	0	0
G	3	0	0.0	0	0	0	0	0	0	0	0

Page 16 of specification for Phase F states 12second CMX clearance and 2second pestrrian demand hold

Phase - Pelican, Puffin and Toucan Times

 Subject: A96 / Lochloy Rd Traffic Signals - Nairn

Please find attached the specification used to develop the LinSig model of the A96 / Lochloy Road junction in Nairn. As discussed, the consultant has replicated the following intergreen matrix from the attached however, unlike the handset limits, it would appear to indicate no intergreen value from peds back to traffic which I would have thought is incorrect. Any clarification you can provide on this would be appreciated.

Regards

Subject: RE: A96 / Lochloy Rd Traffic Signals - Nairn

Hi [REDACTED]

The handset limits (page 10) should be ignored in this case and the intergreens on page 9 used for all traffic to traffic and traffic to ped movements. The handset limits have nothing to do with the calculation of the CMX times.

The maximum (worst case) intergreen following the ped stage is 17 seconds which comprises of; the 3 seconds Min Ped Clearance (page 8) **plus** the 12 seconds CMX time **plus** the 2 seconds starting amber. The handset limit and pedestrian demand hold times do not apply here.

Within your modelling exercise you will have to decide how often the ped stage is called and how much of the CMX period is used.

Importance: High

[REDACTED]

Thanks for the information below. I am currently preparing a response and just wanted to confirm one final point. As discussed, the model of the junction includes the phase intergreen times on page 9 of the specification and therefore does not take account of pedestrian intergreen controlled by the CMX timings.

The intergreen handset limits on page 10 of the specification has an intergreen before Phase F of 6s and 8s after equating to 14s which is consistent with the CMX (i.e. 12s CMX clearance and 2s pedestrian demand hold).

The model is currently running with an 8s intergreen before Phase F and '0' after. Instead of '0', should this be modelled as 6s to match the CMX timings or for the purpose of assessment, model the intergreen handset limits on page 10.

Happy to discuss. You can contact me on [REDACTED]

Thanks

[REDACTED]

Thanks for the further clarification. One final question, if 17s represents the worst case, would there be a minimum intergreen following the ped stage. Is there a minimum CMX time that would apply in addition to the 3s ped clearance and 2s starting amber?

Regards

Attachments: Scanned from a Xerox Multifunction Printer.pdf; Scanned from a Xerox Multifunction Printer.pdf

Hi [REDACTED]

Here are some plans of development phases at Lochloy since around 2000.

The one plan shows the whole area and the other the last phase of development by Springfield (for which is well underway 178 houses) over a 100 of which have been completed.

Estimates of houses in this area approximately 350 - 375.

Let me know if you need anything else.

Hi [REDACTED]

This item will not be going to the next committee as hoped.

Number of matters has caused this decision: -

- Need for final information from applicant
- Need for statutory consultee input
- Other applications and
- Easter Holidays – resulting in key staff being absent and deadline for committee reports being pulled forward.

This will now go to the June 12 committee.

I would appreciate the TS response [REDACTED] as soon as possible as I need to re-consult my own transport people on its content.

Transport Scotland

Trunk Road Network Management

TR/NPA/1A

I acknowledge receipt of the planning application 17/05667/FUL for Residential development & associated infrastructure at Land 123M SE Of Rosebank Kingsteps Lochloy Road Nairn which was received on 24/01/2018.

Planning Officer: [REDACTED]

I am currently assessing the implications of the planning application on the trunk road but will not be able to respond within the normal timescale for the reasons stated below. I should therefore be obliged if you would extend the consultation period until this process is completed.

Reasons

Transport Assessment requires to be audited

Until the formal issue of a TR/NPA/2 this Notice must be taken as intent to respond recommending conditions relating to this application, or to refuse the application. On this basis the interest of the Transport Scotland, an agency of the Scottish Government, as a Statutory Body must be taken into account.

[REDACTED]

I note and welcome your involvement in reviewing the impact of the proposed development at Kingsteps, Nairn on the A96 trunk road, and in particular the Locally Road/A96 Junction.

I write to make you aware of the involvement of there Kingsteps Residents Group in challenging the findings of the applicants Traffic Impact Assessment Report as prepared by One Arup.

I append our initial review of the TIA together with our subsequent response to Ove Arup response to both our and the River Community Councils review.

We are concerned at the impact of the proposed additional 115 houses will have on the A96 traffic flow through Nairn which is already heavily congested appeal times. Its is clear that the Lochloy Road junction already has a significant impact on the traffic flow of the A96. It is worth noting that if the additional 115 houses are constructed it will result in some 25% of Nairn's population using the Lochloy Road junction as the only access to the A96.

We look forward to your own review of the situation and trust that you will take on board our own review of the TIA.

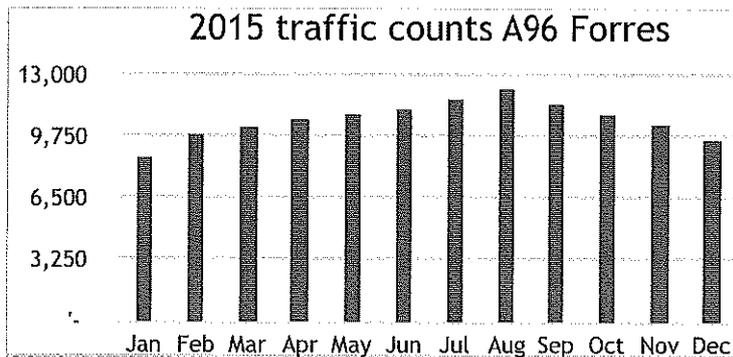

Kind Regards

[REDACTED]

Critique of Transport Assessment for Kingsteps Development.

1. The TA completely ignores the fact that all initial egress from the development is through two narrow residential streets ? to be called Dulnain St. and Averon St. There are 9 houses with drives onto these roads, where they will be backing out into all the traffic from 115 houses. Usually there has to be a distributor road into a major development like this.
2. Traffic counts taken on April 4th 2017. A low time of year (see graph)
Can expect 10 - 20% increase in later months.

3. The development is judged for traffic purposes to be 'completed by 2019'. (part 1 p 19) This is clearly nonsense, and is purely to avoid annual traffic growth uplifts until true completion which is likely to be 5-10 years.
Scottish Gov. Guidelines: 'Design dates for appraisal should generally be for shortly after opening, within a year, especially for retail and employment uses, or on completion of the development in the cases where the development is large and phased over a long period of time (e.g. large residential developments).'
4. The Consultants rationale that traffic has not grown since 2008 is based on estimated figures, not true counts. (Table 6.2) The traffic at this point has not been counted since 2008. True counts from the DfT Gollanfield counter show an increase of average daily flow from 11778 in 2006 to 13240 in 2016. (12.5% increase in 10 years).
5. All the calculations on page 22 of TA part 1 are incorrect as NA 5 has around 360 houses planned/built on it, the figure of 685 used includes older parts of the development.
6. Trip rates are extremely low, and not appropriate for out of town site with poor public transport links (bus stop 800m away apparently). It is inconceivable that only 6 morning rush hour trips will be made from 25 affordable houses. These houses will all have families in them. Generally 0.5 or above is around the figure local authorities should expect for mainly private developments in edge of town settings with poor transport links.
Remembering that the TRICS trip rate is an average of trips from different towns, there is a 50% chance of it being higher whatever level it is set at.
There has been no attempt to provide the output from the TRICS search in an appendix, which is required by the HC guidelines. 'The output from the TRICS selection process should be included in the TA as an appendix'
The comparison of TRICS and observed trips (table 6.9) are worthless, as TRICS includes LGVs HGVs and buses, whereas the consultants have used only cars, and omitted the significant numbers of commercial vehicles. In addition Montgomerie Drive is not the only exit from this area, 4% of cars are estimated to exit from Sutors Way.
They have actually been economical with the truth at the bottom of page 22 as their figure of 204 is for cars only not 'traffic' - there are a further 10 LGVs and 3 HGV/bus departures, which count as 21 car equivalents.
This affects all the calculations.
7. Traffic Lights.

There seems to be a major input error in the package to assess whether the Lochloy lights can cope.

On TA part 2 p11. diagram (Total trips 2019) there are 362 vehicles approaching the lights from Lochloy Rd. In Part 4 p6 the number is entered as 326. Many of the figures in this Scenario 1 table for the Lochloy traffic flows are wrong on the low side.

8. This has a major impact on the lights which would be at 87% capacity against an allowed maximum of 90% if the correct figure was used. This percentage is against the maximum capacity of the Lochloy junction calculated as if it had unrestricted egress from the junction. As the A96 through Nairn is stacked back across all junctions during both rush hours, the maximum flow capacity of the lights from Lochloy road at 419 is vastly overstated, meaning the junction will be even more overwhelmed than it is at present.
9. The traffic light sequencing is very odd, with only 2 seconds allowed for pedestrians to finish crossing after their light goes red and the traffic starts on the A96. This is clearly very unsafe.
10. In general the 'deadtime' between reds is extremely short, (5 and 8 seconds) presumably because it is not possible to get the software to get the cars through otherwise. This is much shorter than previous TAs for Nairn and clearly is unachievable with stacked traffic.

Conclusion:

1. Dangers :
 - a) Access through narrow residential streets with house drives and gardens onto street.
 - b) Pedestrian phase of lights dangerously short.
2. Major underestimation of traffic.
 - a) April counts. Expect 10 - 20% increase in other months.
 - b) Omission of LGVs/HGV/Buses in observed counts.
 - c) Very low trip rates
 - d) Major errors in entering traffic stats into traffic lights software
 - e) Not using true counts for growth figures only estimates.

Subject: Planning Application :17/05667/FUL - NA2 Kingsteps

Re: HC application Planning Application :17/05667/FUL - NA2 Kingsteps, Nairn

The Kingsteps residents group has read with concern recent correspondence between Transport Scotland (as represented by yourself) and ARUP in connection with this planning application, and respond and comment as follows:-

Transport Scotland recognise the Lochloy/A96 junction as 'critical' as far as overloading and A96 delay is concerned, and local residents experience gridlock at this junction for several hours per day.

We are vexed that what is being experienced daily on the ground is apparently being ignored, and extensive manipulative computer modelling by people in the Central Belt who may never have been in our town given precedence.

Are you on behalf of TS not liaising with Highland Council Transport Planning team who have put in a thorough and rigorous critique of the TA and asked for several sections to be rewritten?

As it now appears that a safe pedestrian phase will take the capacity of the lights over the maximum 90% in most directions, surely great caution must be taken to avoid any possible underestimate of the true volume of traffic.

We have checked the pedestrian crossing time and it takes a fit adult 8 seconds to cross the three lanes. In the ARUP TA and their subsequent submissions there are several Individual sources of error which TS seems to be regarding as not significant, which when added together will attain major significance and have the capacity to create even more havoc at this junction.

1. TRICS underestimate.

We do not accept that incorrect TRICS data should be accepted by you on behalf of TS. This is not an option for transport watchdogs. If it's wrong it must be corrected. Highland Council have asked that the whole TRICS analysis be redone to reflect accurately this isolated development (see below)

'Given this, we ask that the TRICS outputs are redone to better reflect the location of this site.' (HC)

TS have asked ARUP that it be considered as private houses. Why has this not been done?

With a critical junction like this we would also have expected a stress test of 85% centile to be done, not 50% (a 50% chance that the levels will be higher.)

- **40% undercount of development traffic**

2. Traffic Diagrams and Analyses

We have still not had any audit trail from ARUP to the traffic figures entered into the analyses in spite of requests from ourselves and HC.

How have they been accrued from the traffic counts, and are they trips or PCUs? It makes a huge difference.

- **Possible major undercount.**

3. Completion of Development

It is clearly nonsense to say the development will be completed next year. Private house completion in the whole of Nairnshire has been around 20/year for the last decade (HC stats.) Springfield know this.

It is very worrying that TS watchdogs are condoning this rubbish in complete ignorance of the facts.

A development of 115 houses in Nairn will take at least 7 years to complete maybe longer.

Highland Council have also criticised this section in their objections. (see below)

'Given that we are already in 2018 and there is no Planning Permission or Road Construction Consent in-place, we are of the opinion that achieving completion of the full 115 units proposed by 2019 is still overly optimistic and should be extended accordingly and justified' (HC)

As TS watchdog, you cannot possibly be seen to be accept this fantasy that the development will be completed next year when Locals and their Council completely disagree on statistically proven grounds.

Your own TS/SG guidelines say:

*'Design dates for appraisal should generally be for shortly after opening, within a year, especially for retail and employment uses, or **on completion of the development in the cases where the development is large and phased over a long period of time (e.g. large residential developments).**'*

2% traffic growth per year must therefore be added to background traffic for a minimum of 5 years.

- **10% + undercount of all traffic over next 5 years**

4. Seasonal Traffic Increase in Highlands

You have stated that April 4th is a shoulder month, therefore you are ignoring the increase of traffic for the subsequent 6 months each year as the holiday traffic causes chaos.

This is not Glasgow, and traffic patterns here are very different from the Central Belt.

If the lights are at 90% in April 2019 then what will it be like with the 20% summer increase?

It is quite unacceptable that there is no acknowledgement of the very seasonal nature of traffic flow in the Highlands, which is proven by statistics from your own TS local counters.

- **Up to 20% undercount of all traffic for 6 months of year**

5. Omission of R filter phase and no account taken of westward exit blocking.

Highland Council pointed out that there has been no allowance in the traffic light phasing for the westward traffic flow to filter right.

There is a filter, and clearly the eastbound traffic is stopped while this takes place. We see nothing from ARUP to prove that this has been satisfactorily modelled that can be checked by either HC or concerned parties.

We also ask if you are aware that as soon as westbound traffic crosses the lights it is frequently halted by right turners into two entrances to busy retail units, and then a third road down to a huge caravan park. (Three right turns in 40m)

It is clearly completely unacceptable to have the saturation flow modelled as if there is clear exit from the junction when traffic frequently comes to a standstill metres after going through the lights.

- **Major overestimation of flow capacity both ways at Lochloy junction.**

Conclusion

With a safe pedestrian phase the lights will be above the permitted maximum of 90% and it is accepted that general traffic will increase 10% in five years with 20% seasonal traffic on top. To compound the problem of this undercount, flow rates through the lights are greatly overestimated.

We would ask that as a representative of Transport Scotland in a watchdog role you will not accept erroneous and potentially misleading figures from ARUP in support of this application, or piecemeal bits of revisions here and there.

TS could suffer serious reputational damage if they are not seen to be doing their job with due rigour.

TS should, in conjunction with HC insist that a properly rewritten, recalculated and presented TA addressing all parties' concerns will be submitted for full scrutiny and consultation.

Local people experience the misery of this junction on a daily basis, TS knows it's gridlocked and an unacceptable major choke point on the A96. Fiddling with computers in the central belt is not going to make this go away.

We have duly copied this letter and our concerns to [REDACTED] the Planning Officer at Highland Council.

[REDACTED]

Many thanks for your response to my and Nairn residents concerns over the current traffic congestion on the A96 through Nairn, and the impact that the new proposed developments will have on the traffic flow.

It's good to learn that Transport Scotland are monitoring the traffic flow, and I note that there has been "minimal variation" - as a local resident I can confirm that this is indeed the case and the A96 through Nairn continues to be congested.

Whilst traffic monitoring and computers are all very well I believe however that there is nothing to beat local knowledge. This afternoon for example it took me 35 minutes to travel through Nairn on the A 96 - the congestion being caused as always by the hold up at the Lochloy Road/A96 Junction. It is a well known fact that it is this junction which continues to cause the severe congestion to the flow of through traffic, hence our objections to approving the building of a further 115 houses at Kingsteps together with the ongoing house building at the Lochloy housing estate.

It is abundantly clear that these developments will seriously impact on the A96/ Lochloy Road junction and hence our disbelief that Arup's conclusion that there would be no effect on the traffic flow of surrounding roads. Their Traffic Impact Study has been shown to be seriously flawed and in no way does it represent the true situation as experienced daily by Nairn's residents.

Finally I trust that when considering the situation Traffic Scotland will take due account of all proposed new developments which will further impact on the A96 - namely the proposed 35 houses planned for Forres Road, Nairn and the retail development and drive through McDonald's outlet planned for the Sainsbury site beside the A96.

I, and the people of Nairn, await with interest the response of Transport Scotland to the current Planning Application.

Regards

Dear [REDACTED]

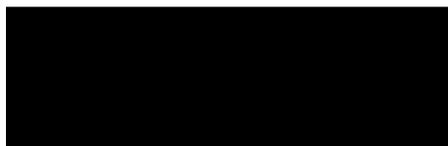

Thank you for your previous and more recent correspondence below. Transport Scotland is aware of the concerns of local residents in relation to the operation of the traffic signal controlled junctions on the A96 through Nairn. Transport Scotland proactively meets with representatives of the local community to discuss relevant A96 matters that are raised. In response to wider network concerns, Transport Scotland has put measures in place that allows journey times through Nairn to be

monitored. This monitoring indicates minimal variation to journey times across the calendar year.

With regards to this particular planning application and the work undertaken by ARUP in support of it, the Lochloy signals have recently been re-assessed by Arup based on specific on-site records which will now allow Transport Scotland to consider its response to the planning application to be considered in accordance with current policy and guidance in the normal manner and taking the significance of potential variation to assessment factors into consideration.

We trust that the above clarifies the position of Transport Scotland in relation to this matter however, please do hesitate to contact me should you wish to discuss the concerns raised in more detail.

Transport Scotland is continuing to liaise with the Operating Company regarding receipt of this data however until received, it is difficult to provide a firm indication of timescales. Notwithstanding this, we are hopeful that the data will be provided for review early next week.

We trust the above is of assistance and we will seek to provide you with a further update on progress once the data is received.

[REDACTED]

Thanks for this update, can you give Springfield as applicant and the local authority as Planning Authority an indication of likely timescale to obtain, review and respond?

Many thanks.

Hi [REDACTED]

Thanks. In this case I think it would be sensible and to avoid further delays given there is still a review and response period for Springfield to commission the survey work via ARUP as previously discussed which I believe will gather the Data you're seeking?

Kind regards

Good morning [REDACTED]

We are now really pushed for a committee deadline for this application – the end of this month for April. Could you now confirm that we are okay, your various concerns and queries addressed and that you can respond accordingly to THC on the application?

Apologies for pushing you on this but time is of the essence.

Regards

Good afternoon [REDACTED]

Following our earlier conversations and email correspondence, please find attached a briefing paper which summarises the results from a series of minor sensitivity tests for the A96(T) / Lochloy Road signalised junction. These tests have been undertaken to address the latest set of comments received from Transport Scotland (see below). The overall findings and conclusions of the original Transport Assessment remain unchanged.

To date, we have addressed all comments received from TS (and BEAR) and trust that the attached will now allow you to finalise your response to Highland Council with respect to the planning application for the 'NA2' site.

Should you have any queries, please let me know.

Regards,
