The Scottish Greenhouse Gas Emissions Annual Target Report for 2016

Incorporating report on impact on emissions of exercise of electricity generation related functions

Laid before the Scottish Parliament by the Scottish Ministers under Sections 33 and 38 of the Climate Change (Scotland) Act 2009

Contents

Summary

Introduction

Part 1 – Annual and Domestic Effort Targets

Part 2 - Net Scottish emissions

Part 3 – The Net Scottish Emissions Account (NSEA)

Part 4 – Scottish electricity consumption and generation

Annex – Accounting For The EU Emissions Trading System (EU ETS)

Summary

This is the seventh report on the Scottish greenhouse gas emissions annual target required under section 33 of the Climate Change (Scotland) Act 2009 ('the Act'), and relates to the 2016 target year. It also fulfils the requirement under section 38 of the Act to report on the impact on emissions resulting from the exercise of electricity generation related functions (see Part 4).

For the purposes of this report, reporting requirements under section 33 of the Act have been separated into four parts as follows:

Part 1: Annual and Domestic Effort Targets

Part 1 of this report shows that both the annual and domestic effort targets for 2016 were met.

Part 2: Net Scottish Emissions

Part 2 of this report contains information on net Scottish emissions. "Net Scottish emissions" are defined in the Act as the amount of "Scottish emissions", reduced by the amount of "Scottish removals" of a greenhouse gas.

"Scottish emissions" covers all emissions from sources territorially located within Scotland, plus Scotland's share of mobile transport emissions, including domestic and international aviation and shipping.

"Scottish removals" refer to the removal of carbon dioxide from the atmosphere by carbon sinks. Carbon sinks are defined by the United Nations Framework Convention on Climate Change (UNFCCC) as "any process, activity or mechanism which removes a greenhouse gas, an aerosol or a precursor of a greenhouse gas from the atmosphere" – for instance woodlands.

In 2016, net Scottish emissions are estimated to have been 38,574,259 tCO₂e. This was 10.3 per cent lower than the 2015 figure of 43,005,816 tCO₂e, or a 4,431,557 tCO₂e decrease. Between 1990 and 2016, there was a 49.0 per cent reduction in net Scottish emissions.

Part 3: The Net Scottish Emissions Account (NSEA)

Achievement of Scotland's greenhouse gas emissions targets is measured against the level of the net Scottish emissions account (NSEA). The NSEA is defined in the Act as the aggregate amount of "net Scottish emissions" of greenhouse gases, reduced / increased by the amount of carbon units credited to / debited from it in accordance with the Carbon Accounting Scheme Regulations made under the Act.

There are two mechanisms by which carbon units can be credited to / debited from the NSEA.

- As the result of the operation of the EU Emissions Trading System (EU ETS) in Scotland. The details of this mechanism are set out in the Annex to this report.
- ii. Ministers may credit to the NSEA any international carbon units purchased by them, thereby offsetting domestic emissions.

In 2016, 2,906,763 units were debited to the NSEA as a result of the operation of the EU ETS. No units were credited to the NSEA as a result of the purchase by Ministers of international carbon units. The NSEA figure was 41,481,022 tCO₂e. The fixed annual target for 2016, as set by the Climate Change (Annual Targets) (Scotland) Order 2010, is to reduce emissions to 44,933,000 tCO₂e. This means that the fixed annual target for 2016 was met by 3,451,978 tCO₂e.

Based on the NSEA, Scotland's emissions increased by 2.5 per cent in 2016 on the previous year. The longer term trend to date shows a reduction of 45.2 per cent from the 1990/1995 baseline period.

Part 4: Scottish electricity consumption and generation

Part 4 of this report shows that in 2016, gross electricity consumption was 30,908 GWh. In 2016, Scottish electricity generation was 45,845 GWh. In 2016, the average greenhouse gas emissions per megawatt hour of electricity generated is 54gCO₂e/kWh.

Section 38 of the Act is also reported on in this section. This requires a report in respect of each year in the period 2010-2050 that, in so far as reasonably practicable, sets out the impact on net Scottish emissions during that year resulting from the exercise by the Scottish Ministers of the functions conferred on them by virtue of any enactment relating to electricity generation.

In 2016, six projects in Scotland were consented after consideration under section 36 of the Electricity Act 1989. Of these, five related to onshore wind projects (totalling 289 MW) and one to a thermal CHP power plant (159 MW). There were a further three projects licensed by Marine Scotland (in addition to those licensed under section 36 of the Electricity Act), one of which was an offshore wind project (18 MW), one tidal project (2MW) and one wave project (0.045 MW).

Results of modelling suggest that these consented projects, should they become operational, could reduce GB system wide carbon emissions by an estimated 0.246 MtCO₂ in the year 2022.

Introduction

The Climate Change (Scotland) Act 2009¹ ("the Act") set targets to reduce Scotland's greenhouse gas emissions by 80 per cent below the baseline period² in 2050, with an interim target to reduce emissions by at least 42 per cent by 2020.

The Act also requires Scottish Ministers to set, by order, annual targets for Scotland's greenhouse gas emissions, consistent with achieving the long-term (2050 and interim 2020) targets, at least 12 years in advance. In October 2010 the Scottish Parliament passed legislation introducing the first batch of annual targets, for the years 2010 to 2022³. The second batch, for 2023-2027, was set in October 2011⁴. The third batch, for 2028-2032, was set in October 2016⁵. Future batches are required to be set at 5-year intervals.

Reports on annual targets

Section 33 of the Act requires that Scottish Ministers lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 for which an annual target has been set – a "target year". Reports must be laid before the Parliament no later than 31 October in the second year after the target year.

The report must state:

- Whether the annual target for the target year has been met. If the annual target has not been met, the report must explain why.
- Whether the domestic effort target has been met in the target year to which the report relates. If the domestic effort target has not been met, the report must explain why.
- The report must contain information mentioned in section 34 of the Act, including the amount of net Scottish emissions and the net Scottish emissions account (NSEA).

Content

This report relates to the 2016 target year.

Further Information

The latest greenhouse gas emissions data for Scotland are available in the Official Statistics publication *Scottish Greenhouse Gas Emissions*, 2016⁶, which is based on data published at the same time in *Greenhouse Gas Inventories for England*, *Scotland*, *Wales and Northern Ireland*: 1990-2016⁷.

Part 1 – Annual and Domestic Effort Targets

Requirements of the Act

Section 33 of the Act requires that:

- The Scottish Ministers must lay before the Scottish Parliament a report in respect of each year in the period 2010-2050 for which an annual target has been set (a "target year") (subsection (1)). The report under this section must be laid before the Parliament no later than 31 October in the second year after the target year (subsection (7)).
- The report must state whether the annual target for the target year has been met (subsection (2)).
- If the annual target has not been met, the report must explain why (subsection (3)).
- The report must also state whether the domestic effort target has been met in the target year to which the report relates (subsection (4)).
- If the domestic effort target has not been met, the report must explain why (subsection (5)).
- The report must contain information mentioned in section 34 of the Act (subsection (6)). This is covered in parts 2, 3 and 4 of this report.

Annual target

The annual target for 2016 was met

Achievement of Scotland's greenhouse gas emissions annual targets is measured against the level of the net Scottish emissions account (NSEA). The NSEA accounts for the greenhouse gas emissions from sources in Scotland, Scotland's share of emissions from international aviation and international shipping, the effect of any relevant emissions sequestration (e.g. "carbon sinks" such as woodland) and the effect of the sale and purchase of relevant carbon units (tradable emissions allowances). Part 3 of this report contains information on the NSEA, including the total amount of carbon units that have been credited to or debited from the NSEA.

In 2016, the amount of the NSEA was 41,481,022 tCO₂e. The fixed annual target for 2016 is to reduce emissions to 44,933,000 tCO₂e⁸. This means that the fixed annual target for 2016 was met by 3,451,978 tCO₂e.

Table 1: Margin between the annual emissions target and the net Scottish Emissions Account (NSEA) in 2016 (tCO₂e)		
Annual target (A)	44,933,000	
Net Scottish Emissions Account (B)	41,481,022	
Margin by which target is met (+) or missed (-) (A – B)	+3,451,978	

⁸ The Climate Change (Annual Targets) (Scotland) Order 2010, SSI 2010 no. 359: http://www.legislation.gov.uk/ssi/2010/359/contents/made

Domestic Effort Target

The domestic effort target for 2016 was met

Section 8 of the Act places a duty on the Scottish Ministers to ensure that reductions in net Scottish emissions of greenhouse gases, account for at least 80 per cent of the reduction in the net Scottish emissions account in any target year – the "domestic effort target". For the specific purpose of ascertaining whether this target has been met, the Act stipulates that the use of carbon units through the operation of the EU ETS is treated as though it is a reduction in "net Scottish emissions".

Table 5 in Part 3 of this report shows the change in net Scottish emissions (including the operation of the EU ETS) between 2015 and 2016 as a proportion of the change in the NSEA between 2015 and 2016. It shows that 100 per cent of the change in the NSEA is accounted for by changes in net Scottish emissions and for the purposes of this report, the domestic effort target has been met.

Part 2 - Net Scottish emissions

Requirements of the Act

Section 34 of the Act requires that, in respect of each greenhouse gas, the report must:

- state the amount of net Scottish emissions for the baseline year (subsection (1)(a)).
- state the amount of net Scottish emissions for the target year (subsection (1)(b)).
- state whether the amount of net Scottish emissions represents an increase or decrease compared to the equivalent amount for the previous target year (subsection (1)(c)).
- identify the methods used to measure or calculate the amount of net Scottish emissions (including in particular any change to those methods) (subsection (1)(d)).

The report must also set out the aggregate amount for the target year of net Scottish emissions (subsection (2)).

If the method of measuring or calculating net Scottish emissions changes and that change is such as to require adjustment of an amount for an earlier target year, the report must specify the adjustment required and state the adjusted amount (subsection (6)). An adjustment must, in so far as reasonably practicable, be made in accordance with international carbon reporting practice (subsection (7)).

Net Scottish emissions of each greenhouse gas

Table 2 provides data for each of the seven greenhouse gases covered by the Act. This includes details of:

- The amount of net Scottish emissions for the baseline year, and for 2016 (the target year);
- Whether any of those amounts represent an increase or decrease compared to the equivalent amount for the previous year; and
- The aggregate amount for 2016 of net Scottish emissions.

Table 2: Net Scottish emissions for each greenhouse gas (tCO₂e) ⁹				9	
Greenhouse gas	Base year	Net base year emissions	Net Scottish emissions 2015	Net Scottish emissions 2016	Change in net Scottish emissions 2015 - 2016
Carbon dioxide CO ₂		57,366,238	31,522,487	27,338,048	-4,184,439
Methane CH ₄	1990	13,455,418	6,597,838	6,451,438	-146,401
Nitrous oxide N ₂ O		4,587,469	3,438,346	3,382,074	-56,272
Hydrofluorocarbons HFCs		126,416	1,295,165	1,234,038	-61,128
Perfluorocarbons PFCs		115,777	119,549	132,211	+12,662
Sulphur hexafluoride SF ₆	1995	36,032	32,123	36,112	+3,989
Nitrogen trifluoride NF3 ¹⁰		501	307	338	+31
Aggregate net greenhouse gas emissions	,	75,687,849	43,005,816	38,574,259	-4,431,557

⁹ Figures may not sum due to rounding.

⁻

¹⁰ The Climate Change (Additional Greenhouse Gas) (Scotland) Order 2015 (http://www.legislation.gov.uk/ssi/2015/197/pdfs/ssi 20150197 en.pdf) adds nitrogen trifluoride (NF₃) to the basket of greenhouse gases covered by the Climate Change (Scotland) Act 2009.

Methods used to measure or calculate the amount of net Scottish emissions

The basket of greenhouse gases consists of carbon dioxide, methane, nitrous oxide, and hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulphur hexafluoride (SF6) and nitrogen trifluoride (NF3). Greenhouse gases are weighted by Global Warming Potential (GWP) and presented in *carbon dioxide equivalent* units. The GWP for each gas is defined as its warming influence relative to that of carbon dioxide, as specified by the Intergovernmental Panel on Climate Change (IPCC).

Greenhouse gas emissions estimates are provided by Ricardo Energy and Environment and Aether under contract to the UK Government and the devolved administrations. Reports are published on the National Atmospheric Emissions Inventory (NAEI) website¹¹ and the latest figures for Scotland are published in the Official Statistics publication *Scottish Greenhouse Gas Emissions*, 2016¹², which is based on data published at the same time in *Greenhouse Gas Inventories for England*, *Scotland*, *Wales and Northern Ireland*: 1990-2016¹³.

The greenhouse gas inventory covers anthropogenic sources of greenhouse gas emissions from a wide variety of emissions sources, which require different approaches to their estimation. There are a large number of data sources used in its compilation, obtained from Government statistics, regulatory agencies, trade associations, individual companies, surveys and censuses. The methods used to compile the greenhouse gas inventory are consistent with international guidance on national inventory reporting from the IPCC.

Most emission estimates are compiled by combining activity data (such as fuel use) with a suitable emission factor (such as amount of CO₂ emitted per unit of fuel used). Estimates of emissions from the industrial sector are often compiled based on plant-specific emissions data. Emissions from some sectors are based on more complicated models - such as the model used to estimate emissions from landfill, and the model used to estimate the carbon dynamics in soils when trees are planted. Much of the data on net emissions from agriculture and related land use, land use change and forestry emissions are based on modelled data for Scotland, which are consistent with, but not constrained to, the UK totals and thus are known as "bottom up" estimates.

Many of the remaining emissions sources within the inventory have been collated on a "top down" approach where estimates of emissions have been apportioned to Scotland using proportions of energy use in the UK Department for Business, Energy and Industrial Strategy publication *Digest of UK Energy Statistics (DUKES)*¹⁴. This approach is prompted by data availability on emissions being more limited at the sub-UK level.

<u>Changes to methods used to measure or calculate the amount of net Scottish</u> emissions

Scottish greenhouse gas emissions are reviewed every year, and the whole historical data series is revised to incorporate methodological improvements and new data. As a result, both net Scottish emissions and the net Scottish emissions account for each target year are revised every year. The latest published Scottish greenhouse gas inventory (1990-2016) represents the best available data and supersede any previous data, which should be disregarded.

The Scottish greenhouse gas inventory is a subset of the UK inventory, which is assembled using international guidelines that require countries to keep it under review and take account of amongst other things:

- new data and revisions to data:
- o international developments in inventory methods;
- the need for the inventory to take account of policy needs as they evolve;
- o results of research.

All of the revisions to the 1990-2016 Scottish and UK inventories were for one of the reasons above.

Revisions for the 1990-2016 inventory

Due to methodological improvements and new data, as described above, there has been a cumulative upwards revision to emissions across the entire time series between the 1990-2008 and 1990-2016 inventories. Baseline emissions in the 1990-2016 inventory are 5.5 MtCO2e (7.8 per cent) higher than the 1990-2008 inventory.

Detailed information on revisions for the 1990-2016 inventory are published in the Official Statistics release *Scottish Greenhouse Gas Emissions 2016* (Section D)¹⁵. The most notable revisions are:

1. Forestry.

Methodological change to series has increased the sink. The area reported as forest remaining forest has been revised upwards. There are also changes in the model for calculating forest carbon stock. This has resulted in an increase in the magnitude of the sink from forest land across the time series.

2. Shipping

Improvements to the methodology for estimating shipping emissions has resulted in an increase in the estimates for gas oil and fuel oil used in Scotland. This has caused recalculations for emissions from domestic navigation and fishing vessels.

3. Agriculture and Related Land Use

Lower estimated nitrous oxide emissions from agricultural soils and the use of a new emission factor model for enteric fermentation incorporating UK-specific parameters are the largest contributors to recalculations from the agriculture sector in Scotland.

Adjustment of an amount for earlier target years

Revisions to estimates of net Scottish emissions for earlier target years are detailed in Table 3. These represent revisions to 1990-2015 inventory estimates published in the Annual Target Report for 2015. Revisions arising from previous inventory reports are available in previous annual target reports¹⁶.

Table 3: Revis	ions to net Scottish emis	ssions for earlier to	arget years
Target year	Net Scottish emissions reported in the 2015 Annual Target Report (tCO ₂ e)	Revision required (tCO ₂ e)	Revised amount (tCO₂e)
	FOR THE 1990-2	016 INVENTORY	
2010	61,798,157	-5,974,961	55,823,196
2011	55,497,246	-6,334,324	49,162,922
2012	56,284,564	-4,827,696	51,456,868
2013	53,727,580	-5,333,301	48,394,279
2014	49,515,198	-5,155,721	44,359,477
2015	48,051,092	-5,045,276	43,005,816

REASONS FOR REVISIONS. These are described above and in more detail in the Official Statistics Release *Scottish Greenhouse Gas Emissions 2016*

⁻

 $^{^{16}\ \}underline{\text{https://www.gov.scot/Topics/Environment/climatechange/meetingemissionstargets/reportingonprogress}}$

Part 3 - Net Scottish Emissions Account (NSEA) for 2016

Requirements of the Act

Section 34 of the Act requires that the report:

- state the amount of the net Scottish emissions account for the target year (subsection (3)(a)¹⁷).
- state the proportion of the reduction in the net Scottish emissions account which is accounted for by reductions in net Scottish emissions (subsection (3)(b)).
- state the total amount of carbon units:
 - ➤ that have been credited to or debited from the net Scottish emissions account for the target year (subsection (3)(c)(i));
 - ➤ that have been purchased in the target year (subsection (3)(c)(ii));
 - ➤ that have been held and not surrendered in the target year (subsection (3)(c)(iii)).
- give details of the number and type of those carbon units (subsection (3)(d)).
- for each year in the period 2011-2050¹⁸.
 - state the amount of the NSEA for each preceding target year (subsection (5)(a));
 - ➤ state the cumulative amount of the net Scottish emissions account for the target year and all preceding target years (subsection (5)(b)).

Amount of the Net Scottish Emissions Account for 2016

Achievement of Scotland's greenhouse gas emissions targets is measured against the level of the net Scottish emissions account (NSEA). The NSEA is defined in the Act as the aggregate amount of "net Scottish emissions" of greenhouse gases, reduced / increased by the amount of carbon units¹⁹ credited to / debited from it in accordance with the Carbon Accounting Scheme Regulations made under the Act²⁰.

Table 4 provides the amount of the net Scottish emissions account in 2016, including the total amount of carbon units that have been credited to or debited from the NSEA as the result of the operation of the EU ETS in Scotland.

Table 4: Net Scottish Emissions Account for 2016 (tCO ₂ e)			
Greenhouse Gas Inventory	Net Scottish emissions – see table 2 (C) 38,574,259		
Carbon Units	Number of units to be credited to or debited from the NSEA - see table 6 (D)	2,906,763 debited to NSEA	
NSEA	C + D	41,481,022	

¹⁷ If an amount mentioned in subsection 3(a) or subsection (5)(a) or (b) for an earlier period requires to be adjusted, the report must explain why the adjustment is required; specify the adjustment required; and state the adjusted amount (section (34(8) of Climate Change (Scotland) Act 2009).

¹⁹ Carbon units are emissions allowances that represent 1 tCO₂e each. The types of units specified are internationally recognised and are monitored and tracked under United Nations and European Union rules. The units are subject to significant scrutiny and are accepted as representing genuine and verifiable emissions reductions

²⁰ The Regulations were made in 2010, and subsequently amended in 2015, 2016, 2017, and 2018.

Based on the NSEA, Scotland's emissions increased by 2.5 per cent in 2016 on the previous year. The longer term trend to date shows a reduction of 45.2 per cent from the 1990/1995 baseline period.

<u>Proportion of the reduction in the net Scottish emissions account which is accounted for by reductions in net Scottish emissions</u>

Section 8 of the Act places a duty on the Scottish Ministers to ensure that reductions in net Scottish emissions of greenhouse gases account for at least 80 per cent of the reduction in the net Scottish emissions account in any target year – the "domestic effort target". In effect, this ensures that the majority of the action to meet emission reduction targets is taken domestically, rather than by offsetting domestic emissions through the purchase of international credits.

There are two mechanisms by which carbon units can be credited to / debited from the NSEA.

- i As the result of the operation of the EU Emissions Trading System (EU ETS) in Scotland. The details of this mechanism are set out in the Annex to this report.
- ii. Ministers may credit to the NSEA any international carbon units purchased by them, thereby offsetting domestic emissions. The Climate Change (Limit on Carbon Units) (Scotland) Order 2011²¹ sets limits for the period 2013-2017 which allows Ministers the option to purchase (credit) up to 199,000 carbon units in 2016 in addition to credits or debits to the Scottish account through the operation of the EU ETS.

For the specific purpose of ascertaining whether the domestic effort target has been met, the Act stipulates that the use of carbon units through the operation of the EU ETS is treated as though it is a reduction in "net Scottish emissions".

For the purposes of the domestic effort target, in 2015 and 2016 the net Scottish emissions and net Scottish emissions account are the same. This is because no units were credited to the NSEA in either of the years as a result of the purchase of international carbon units. This means that the change in net Scottish emissions of greenhouse gases accounts for 100 per cent of the change in the net Scottish emissions account in the 2016 target year (see Table 5).

-

²¹ http://www.legislation.gov.uk/ssi/2011/440/contents/made

	2016 as a proportion		eration of the EU ETS) Net Scottish Emissions
Target Year	Net Scottish Emissions ²²	Net Scottish Emissions Account	Proportion of the change in the NSEA which is

Target Year	Net Scottish Emissions ²²	Net Scottish Emissions Account	Proportion of the change in the NSEA which is accounted for by changes in Net Scottish emissions
2015	40,459,167	40,459,167	
2016	41,481,022	41,481,022	100%
Change between 2015 and 2016	1,021,855	1,021,855	

Carbon Units credited or debited to the NSEA

Table 6 sets out the effect of the EU ETS on the NSEA in 2016. Further detail on this mechanism are set out in the Annex to this report.

Table 6: The effect of the EU ETS on the N (tCO₂e)	let Scottish Emissions Account in 2016
Total amount of units surrendered from fixed installations ²³	10,262,263
Estimate of surrendered CO ₂ emissions from domestic aviation	478,157
Estimate of surrendered CO ₂ emissions from international aviation	1,425,305
Total estimate of surrendered emissions (E)	12,165,725
Fixed installations cap	13,707,475
Domestic aviation cap	443,255
International aviation cap	921,758
Total 2016 EU ETS cap ("Specified Amount") for Scotland (F)	15,072,488
Number of units to be credited or debited from the Net Scottish Emissions Account (E - F) 24 25	2,906,763 debited to NSEA

 24 If (E – F) is positive, carbon units are credited to the NSEA, thus reducing its level.

 $^{^{22}}$ For the purpose of calculating the domestic effort target, Section 8(3) of the Climate Change (Scotland) Act 2009 stipulates that the use of carbon units through the operation of the EU ETS is treated as though it is a reduction in "net Scotlish emissions".

²³ Sourced from SEPA analysis.

 $^{^{25}}$ If (E – F) is negative, carbon units are debited from the NSEA, thus increasing its level.

Table 7 sets out carbon units which have been purchased, and carbon units which have been held and not surrendered.

Table 7: Total amount of carbon units which have been purchased, and those that are held and not surrendered, 2016		
	Number of Units	Type of Units
Number of carbon units purchased	0	Not applicable
Number of carbon units held and not surrendered	0	Not applicable
Amount of carbon units credited to the Net Scottish Emissions Account	0	Not applicable

Amount of the NSEA for each preceding target year and cumulative amount of the net Scottish emissions account for the target year

Table 8 sets out the amount of the net Scottish emissions account for the target year and each preceding target year based on the 1990-2016 greenhouse gas inventory. Table 8 also states the cumulative amount of the net Scottish emissions account for the target year.

Table 8: Amount of the Net Scottish Emissions Account for each target year and the cumulative amount of the Net Scottish Emissions Account for the target year (tCO ₂ e)	
Target Year 2010	54,721,617
Target Year 2011	52,045,625
Target Year 2012	54,226,803
Target Year 2013	45,157,876
Target Year 2014	39,541,084
Target Year 2015	40,459,167
Target Year 2016	41,481,022
Cumulative 2010-2016	327,633,193

Adjustments to net Scottish emissions account for earlier target years and cumulative amount of the net Scottish emissions account for all preceding target years

Table 9 contains data on revisions to previously reported estimates of the NSEA for earlier target years, together with the revised amount and reason for any revision. These represent revisions to 1990-2015 inventory estimates published in the Annual Target Report for 2015. Revisions arising from previous inventory reports are available in previous annual target reports²⁶.

Table 9: Revisions to Net Scottish Emissions Account for earlier target years (tCO₂e)				
Target year	Net Scottish Emissions Account estimate reported in the 2015 Annual Target Report	Revision required	Revised Net Scottish Emissions Account estimate	
FOR THE 1990-2016 INVENTORY				
2010	60,780,578	-6,058,961	54,721,617	
2011	58,463,949	-6,418,324	52,045,625

<u>Impact of inventory revisions on reductions required to meet annual emissions</u> reduction targets

Statutory fixed annual targets for 2010-2027 were set on the basis of the 1990-2008 inventory, which was the latest inventory available at the time. This estimated baseline emissions to have been 70.201 MtCO₂e and the 2020 target was set at 40.717 MtCO₂e, which equated to a 42 per cent reduction in line with the level of the 2020 interim target set by the Act. Successive revisions mean that reductions required to meet each of the fixed annual targets are now significantly greater than was envisaged when the targets were set. For example, to reach the 2020 annual target now equates to a 46.2 per cent reduction in emissions (Table 11).

Year	Targets (in tCO₂e)	Percentage reduction against 1990 baseline when targets were set - using the 1990-2008 inventory	Percentage reduction against 1990 baseline – based on latest (1990-2016) inventory
2010	53,652,000	-23.6%	-29.1%
2011	53,404,000	-23.9%	-29.4%
2012	53,226,000	-24.2%	-29.7%
2013	47,976,000	-31.7%	-36.6%
2014	46,958,000	-33.1%	-38.0%
2015	45,928,000	-34.6%	-39.3%
2016	44,933,000	-36.0%	-40.6%
2017	43,946,000	-37.4%	-41.9%
2018	42,966,000	-38.8%	-43.2%
2019	41,976,000	-40.2%	-44.5%
2020 (year of interim target)	40,717,000	-42.0%	-46.2%
2021	39,495,000	-43.7%	-47.8%
2022	38,310,000	-45.4%	-49.4%
2023	37,161,000	-47.1%	-50.9%
2024	35,787,000	-49.0%	-52.7%
2025	34,117,000	-51.4%	-54.9%
2026	32,446,000	-53.8%	-57.1%
2027	30,777,000	-56.2%	-59.3%

Part 4 – Scottish electricity consumption and generation

Requirements of the Act

Section 34 of the Act requires that the report must:

- state the amount of Scottish gross electricity consumption for the target year (subsection (4)(a)).
- state the amount of Scottish electricity generation for the target year (subsection (4)(b)).
- state the average greenhouse gas emissions per megawatt hour of electricity generated in Scotland in the target year (subsection (4)(c)).
- state the average greenhouse gas emissions per megawatt hour, and the estimated lifetime cumulative emissions, of any new electricity generation capacity greater than 50 megawatts approved in Scotland in the target year (subsection (4)(d)).

This part of the report also fulfills the requirements of Section 38 of the Act. This requires a report in respect of each year in the period 2010-2050 that, in so far as reasonably practicable, sets out the impact on net Scottish emissions during that year resulting from the exercise by the Scottish Ministers of the functions conferred on them by virtue of any enactment relating to electricity generation.

The amount of Scottish gross electricity consumption

In 2016, gross electricity consumption in Scotland was 30,908 GWh²⁷.

The amount of Scottish electricity generation

In 2016, Scottish electricity generation was 45,845 GWh²⁸.

The average greenhouse gas emissions per megawatt hour of electricity generated in Scotland

In 2016, the average greenhouse gas emissions per megawatt hour of electricity generated is 54gCO₂e / kWh.

Note: There are various ways of estimating the average greenhouse gas emissions per megawatt hour of electricity generated in Scotland. In reports prior to the 2014 annual target report (published in October 2016), this calculation used data from the Scottish Pollutant Release Inventory (SPRI) which is collated by SEPA. From the 2014 annual target report, the Scottish greenhouse gas inventory is used for this calculation as it is the basis upon which Scotland's headline greenhouse gas statistics are estimated, and as such is consistent with other emissions data contained within this report. The methods used to compile the greenhouse gas inventory are consistent with international guidance on national inventory reporting from the Intergovernmental Panel on Climate Change (IPCC).

The average greenhouse gas emissions per kilowatt hour of electricity generated in Scotland is calculated using the following formula:

Total emissions from Electricity Generation are obtained from the Energy Supply Sector ("Public Electricity & Heat Production" subsector) of the Scottish Greenhouse Gas Inventory 1990-2016²⁹. The total output figure is taken from the amount of Scottish electricity generation for the target year.

Table 12 shows the emissions intensity of electricity generated in Scotland using data from the Scotlish greenhouse gas inventory for the years 2010 to 2016.

Table 12. Greenhouse Gas Emissions Intensity of Electricity Generated in Scotland (gCO₂e/kWh), 2010 to 2016				
Year	Total Emissions (MtCO ₂ e)	Total Output (GWh) ³⁰	Emissions Intensity (gCO₂e/kWh)	
2010	15.85	49,532	320	
2011	12.13	50,870	238	
2012	12.82	50,333	255	
2013	11.43	53,024	216	
2014	9.80	50,042	196	
2015	7.73	51,351	151	
2016	2.49	45,845	54

³⁰ Electricity generation figures for Scotland are available at https://www.gov.uk/government/statistics/energy-trends-december-2017-special-feature-article-electricity-generation-and-supply-figures-for-scotland-wales-northern-ireland-and-england-2.

Estimated lifetime cumulative emissions of new electricity generation capacity greater than 50MW approved in 2016

Due to longer-term uncertainties in the electricity market it is not possible to estimate lifetime cumulative emissions of new electricity generation capacity.

Emissions impacts are assessed at a GB level, reflecting the fact that the system is operated as a GB wide wholesale electricity market. Our approach is therefore to set out what the impact from any new electricity generation capacity consented by Scottish Ministers under section 36 of the Electricity Act 1989 in the "target year" has on overall GB system wide carbon emissions. The approach includes the impact of all new electricity generation capacity irrespective of scale, which may include extensions to existing installations that take the cumulative capacity over 50MW, and assumes that all consented plants become operational prior to 2022³¹. The results specify the estimated impact on emissions in that year.

In 2016, six projects in Scotland were consented by Scottish Ministers after consideration under section 36 of the Electricity Act 1989. Of these, five related to onshore wind projects (totalling 289 MW) and one to a thermal CHP power plant (159 MW). Results of modelling suggest that these consented projects, should they become operational, could reduce GB system wide carbon emissions by an estimated 0.213 MtCO₂ in the year 2022.

Emissions impacts of these projects are measurable at a GB level, as this is the level at which decisions from the model are made. It should be noted that Scottish Minister's decision to consent does not mean that the projects will become operational. This is subject to commercial and market forces at the individual company level.

Impact on net Scottish emissions resulting from exercise of electricity generation related functions

Section 38 of the Act requires a report on the impact on emissions resulting from the exercise of electricity generation related functions. The report must, in so far as reasonably practicable, set out the impact on net Scottish emissions during that year resulting from the exercise by Scottish Ministers of the functions conferred on them by virtue of any enactment relating to electricity generation.

In 2016, six projects in Scotland were consented after consideration under section 36 of the Electricity Act 1989, with a further three projects licensed by Marine Scotland (in addition to those licensed under section 36). Of these additional projects one was offshore wind (18 MW), one was tidal (2MW) and one was wave (0.045 MW).

The modelling results suggest that the consented projects, should they become operational, could reduce GB system wide carbon emissions by an estimated 0.246 MtCO₂ in the year 2022.

_

³¹ 2022 is chosen as it is considered plausible for generation consented in 2016 to become operational by this date. The results assume that all projects are operating for the full calendar year.

Other information

Under Section 34(9) of the Climate Change (Scotland) Act 2009, this report may contain such other information as the Scottish Ministers consider appropriate and, in particular, may state the amount of Scottish electricity generation from each source for the target year.

Table 13 below shows Scottish electricity generation by fuel for 2016.

Table 13. Generation of electricity by fuel in Scotland (GWh) ³²				
Coal	1,806			
Oil	157			
Gas	1,523			
Nuclear	19,630			
Thermal renewables	735			
Other thermal	0			
Hydro natural flow	3,692			
Hydro Pumped Storage	486			
Non thermal renewables	10,091

Annex

Accounting For The EU Emissions Trading System (EU ETS)

Introduction

This annex outlines the calculation of adjusted emissions to take account of trading in the EU Emissions Trading System (EU ETS).

What is the EU ETS?

The EU ETS is a 'cap and trade' system. A limit (cap) is placed on the overall volume of emissions from participants in the system. Within the cap, organisations receive or buy emissions allowances which they can trade (1 emissions allowance equals 1 tCO₂e). Each year, an organisation must surrender enough allowances to cover its emissions. The cap is reduced over time so that by 2020, the volume of emissions permitted within the system will be 21 per cent lower than in 2005. The reducing cap, alongside the financial considerations of trading emissions allowances, incentivises organisations within the system to find the most cost effective way of reducing their emissions. The EU ETS operates as a number of Phases. Phase III began on 1 January 2013 and will operate until 31 December 2020.

In the greenhouse gas inventory, source emissions can be categorised into traded and non-traded. Traded emissions capture those that come from installations covered by the EU ETS, whereas non-traded emissions are those which do not fall within the scope of the EU ETS. The emissions from some sectors, such as the residential sector, are completely non-traded whereas emissions from other sectors, such as energy supply, business and industrial process emissions are a combination of traded and non-traded. For the years 2012 to 2016, CO₂ emissions from domestic and international aviation are classified as being within the traded sector.

What does this mean for the NSEA?

The figure for source emissions is comprised of emissions from both the non-traded and traded sectors. The figure for NSEA is comprised of emissions from the non-traded sector and a value for Scotland's share of the notional EU ETS cap. The amount of emissions from the non-traded sector remains the same for both the source emissions and the NSEA.

The EU ETS element of the NSEA is calculated by replacing the number of emissions allowances surrendered from Scottish installations in a given year with Scotland's notional share of the overall EU ETS cap. This involves taking the difference between Scotland's notional share of the overall EU ETS cap and the number of emissions allowances surrendered from Scottish installations in a given year. This difference is then added to net Scottish emissions to get the NSEA.

The NSEA is referred to as "adjusted emissions", as they are adjusted to take into account trading within the EU ETS and the purchase of other credits. As no units were credited to the NSEA in 2016 as a result of the purchase by Ministers of international carbon units, this adjustment takes the form of a 4-step process.

Calculation of adjusted emissions for 2016

STEP 1

Take the Scottish greenhouse gas emissions from Scottish greenhouse gas inventory (for 2016, it is 38.574 MtCO2e). This figure is comprised of:

- •traded emissions units surrendered sourced from Scottish Environment Protection Agency (SEPA) for fixed installations (12.166 MtCO2e)
- •an imputed estimate of surrendered CO2 emissions from domestic aviation (0.478 MtCO2e) and international aviation (1.425 MtCO2e) sourced from the Scottish Greenhouse Gas Inventory for 1990 to 2016.
- •non-traded emissions from sources such as residential emissions (26.409 MtCO2e)

STEP 2

Remove an amount relating to surrendered emissions from fixed installations and an estimate of surrendered emissions from domestic and international aviation. This amounts to 10.262 MtCO2e + 0.478 MtCO2e + 1.425 MtCO2e = 12.166 MtCO2e.

STEP 3

Add on the value of the EU ETS cap which is outlined within The Carbon Accounting Scheme (Scotland) Amendment Regulations 2018³³. The cap reflects an estimate of the Scottish share of the European wide EU ETS cap that is used for emissions accounting.

The Scottish EU ETS cap for 2016 is 15.072 MtCO2e and is made up of 3 components, as shown in the table below. A methodological paper, *Determining a Scottish EU ETS cap for 2016*³⁴, documents the calculations that determine how a notional emissions cap has been calculated.

Table 14. Total EU ETS cap for Scotland, 2016 - this is the "specified amount" for fixed installations, domestic aviation and international aviation				
Component	2016 Allocation tCO₂e			
Fixed Installation Cap	13,707,475			
Domestic Aviation Cap	443,255			
International Aviation Cap	921,758			
Total 2016 Cap	15,072,488			

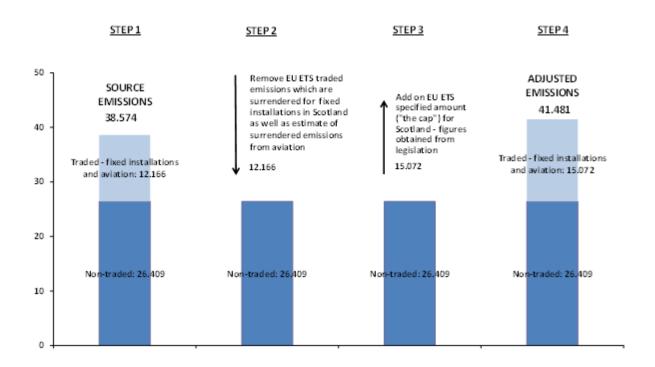

³³ http://www.legislation.gov.uk/ssi/2018/40/made

³⁴ https://www.gov.scot/Topics/Statistics/Browse/Environment/Publications/EUETScap2016

STEP 4

Adding on the value of the EU ETS cap gives a value of 41.481 MtCO2e. This is 2.907 MtCO2e higher than the value of estimated source emissions in 2016. Under the Climate Change (Scotland) Act, 2009, an upward adjustment to source emissions is referred to as a debit from the Net Scottish Emissions Account. This means that 2,906,763 units have been debited to the Net Scottish Emissions Account in 2016.
