

A Stochastic Collision Risk Model for Seabirds in Flight

First ScotMER symposium
Victoria Quay, Edinburgh
2nd October 2018

- Purpose and aims;
- Approach taken;
- Questionnaire;
- Recommendations;
- Comparison of Band (2012) and Masden (2015);
- Implementation;
- Final product.

Purpose

- develop a **stochastic** version of the **Band** model in **R**;
- incorporate **gaps** identified by industry and statutory agencies;
- **robust** and **transparent** method;
- accounting for **uncertainty** in collision rates;
- **easily** applied to real-world situations.

Approach

- Identify gaps;
- Question stakeholders;
- Determine feasible changes;
- Create beta tool (in R);
- Consult (steering group);
- Amend and finalise tool (Shiny app).

Stakeholder questionnaire

- Anonymous;
- Online or PDF or hard copy
- 13 questions
- 41 stakeholders contacted – 25 responses
- Mix of multiple choice and free text

Stakeholder requested changes to sCRM

- Create shiny or user friendly interface for non-R users;
- Speed up code;
- Number of turbines – user input;
- Output predicted collisions probability data;
- Seasonal (as well as monthly & annual) assessment (default + user defined);
- Error checking inputs and collision probability;
- Monthly or seasonal flight height inputs.

Comparisons of Excel-Band and Masden R-code

- The extant code was given detailed comparison with the (non-stochastic) Excel version, with the Excel taken as gold standard
- Stochasticity was suppressed to check point estimates – some minor bugs and discrepancies were found and fixed
- One bug was found which leads to modest bias in mean collisions relative to the Excel versions (due to a shift in flight-heights relative to turbine position). This was corrected.

Modifications to core Masden code

- Restructured for general increases in efficiency and improvements in consistency & clarity – so easier to debug, alter and maintain.
- Fine-scale profiling of the code led to increases in speed (>4x).
- All code was version-controlled and made publicly accessible through a GitHub repository (so can be community maintained)

Shiny

- An R package that helps you build interactive web applications
- Basically it gives users an interface your R code/programs through a web-browser
- The application can housed/used on your local machine or on a remote server

Shiny – some benefits

- Users can interact with R without any coding
- The GUI can be made very user-friendly
- Being a web/browser based app, it is platform independent
- The application, if housed remotely means:
 - Users don't need to have R locally, or maintain R in anyway
 - Updates and fixes are done on the server-based code, so are propagated to all users

Shiny- CRM added functionality

- Pop-up help-prompts, input checking, default values (in some cases)
- Editable input fields
- Can import user-defined flight-height distributions and bootstraps
- Speed increases
- Extended outputs, including files logging the inputs used in the simulations

Shiny-CRM in action

- The project GitHub repository containing code, links & documentation is here:

<https://github.com/dmpstats/stochCRM>

- The app is accessible from the shiny server via this URL

https://dmpstats.shinyapps.io/avian_stochcrm/

- Project documentation via this URL

<https://www.gov.scot/Topics/marine/marineenergy/mre/current/StochasticCRM>

Browser address bar: https://dmpstats.shinyapps.io/avian_stochcrm/

Page title: Avian Stochastic CRM

Version: v2.2.1

Current version - click to get version notes

Workflow menu

- Step 1: Turbine & Wind farm features
- Step 2: Specie(s)
- Step 3: Species features
- Step 4: Simulation & Results

Wind Farm Features

- Number of Turbines: 100
- Latitude (deg): 55.8
- Width (Km): 10
- Tidal Offset (m): 2.5
- Upwind flights (%): 50

Turbine Parameters

- Turbine Model (MW): 6
- No. of blades: 3
- Rotor Radius (m): 80
- Air Gap (m): 26.5
- Max blade width (m): 5.5

Monthly Operation

	January	February	March	April	May	June	July	August	September	October	November
Wind Availability (%)	96.28	96.53	95.83	92.78	90.86	92.22	89.11	89.92	93.71	96.14	
Mean Downtime (%)	6.30	6.30	6.30	6.30	6.30	6.30	6.30	6.30	6.30	6.30	
SD Downtime (%)	2.00	2.00	2.00	2.00	2.00	2.00	2.00	2.00	2.00	2.00	

Monthly wind availability

Monthly turbine downtime (Means & 95% CIs)

Input fields throughout

Note the pages may extend downwards

Shiny-CRM in action

Live/video [demo](#)

The screenshot shows the Avian Stochastic CRM web application. The interface includes a sidebar menu, a main content area with input fields, a table for monthly operation, and two charts. Annotations highlight key features:

- Workflow menu:** A green box on the sidebar menu with an arrow pointing to the 'Step 4: Simulation & Results' option.
- Input fields throughout:** A green box with arrows pointing to various input fields in the 'Turbine Parameters' section, such as 'Number of Turbines', 'Latitude', 'Width', 'Tidal Offset', and 'Upwind flights'.
- Current version - click to get version notes:** A green box with an arrow pointing to the 'v2.2.1' version indicator in the top right corner.
- Note the pages may extend downwards:** A green box with a downward arrow pointing to the bottom of the page, indicating scrollability.

Monthly Operation	January	February	March	April	May	June	July	August	September	October	November
Wind Availability (%)	96.28	96.53	95.83	92.78	90.86	92.22	89.11	89.92	93.71	96.14	
Mean Downtime (h)	6.30	6.30	6.30	6.30	6.30	6.30	6.30	6.30	6.30	6.30	
SD Downtime (h)	2.00	2.00	2.00	2.00	2.00	2.00	2.00	2.00	2.00	2.00	

Monthly wind availability chart shows wind availability (%) for each month from Jan to Dec, with values ranging from approximately 89% to 97%.

Monthly turbine downtime (Means & 95% CIs) chart shows downtime (h) for each month from Jan to Dec, with values around 6.30 h and 95% confidence intervals.

Current & ongoing development

- Users can log bugs and suggestions through the GitHub repository – so modifications are ongoing
- Further speed increases are likely – it still takes some minutes to perform the simulations
- Seasonal flexibility

Overview

- The stochastic CRM has been extended and improved
- It is now accessible via a user-friendly, browser-based application
- The entire project is transparent, open-source and amenable to community-driven improvements
