

Coronavirus (COVID-19): Analysis

State of the Epidemic in Scotland – 16th April 2021

Background

This report summarises the current situation on the COVID-19 epidemic in Scotland. It brings together the different sources of evidence and data about the epidemic in Scotland at this point in time, why we are at that place, and what is likely to happen next. This summarises the data up to and including the 15 April 2021 on COVID-19 in Scotland. This updates the previous publication published on 9 April 2021¹. The information in this document helps the Scottish Government, the health service and the wider public sector respond to the epidemic and put in place what is needed to keep us safe and treat people who have the virus.

This edition of the state of the epidemic, summarises current data on COVID-19 at a national level, at a local level and how Scotland currently compares to the rest of the UK. It looks at the vaccination program in Scotland and the effects which are beginning to be seen from this. Information is provided about variants of concern and what impact these may have. Bringing this information together in one place gives the opportunity to better understand the current state of the epidemic in Scotland.

Key Points

- The reproduction rate R in Scotland is currently estimated as being between 0.8 and 1.0. This is unchanged from the estimate of R on 7 April.
- An average of 250 cases were reported per day in the 7 days to 15 April, which is a 24% decrease in reported cases since the 8 April.
- There were 34 weekly cases per 100,000 in the week to 12 April, which is a decrease since last week. This compares to 302 weekly

¹ Scottish Government: [Coronavirus \(COVID-19\): state of the epidemic - gov.scot \(www.gov.scot\)](https://www.gov.scot/Coronavirus-(COVID-19):-state-of-the-epidemic)

cases per 100,000 on 8 January and is similar to the weekly case rate observed on 21 September.

- Case rates in all age groups have decreased, with the sharpest decline in cases in those aged 60+ this week.
- The estimated proportion of people becoming infected with Covid in Scotland has decreased slightly in the most recent week and is currently below England, but above Northern Ireland and Wales as determined through the latest weekly ONS survey.
- Latest modelled estimates suggest there are currently between 4 and 28 new daily infections per 100,000 people in Scotland.
- Deaths involving coronavirus have declined most in those aged 75-84 over the 3 weeks to 11 April, having gone down by 70%.
- Average daily deaths per 100,000 population in Scotland (0.04) are below Northern Ireland (0.07) and in line with England and Wales (0.04 each).
- Clackmannanshire currently has the highest weekly case rate in Scotland reporting 81 cases per 100,000 in the last week, while Angus, Argyll and Bute, Dumfries and Galloway, Midlothian and Scottish Borders reported fewer than 10 weekly cases per 100,000 in the same time. Na h-Eileanan Siar and Orkney each had 0 cases per 100,000 in the last week.
- At a national level hospital bed and ICU occupancy are projected to fall over the next few weeks, but these both may plateau or increase as a result of schools reopening and other relaxations of non-pharmaceutical interventions.
- Over 2.7 million people in Scotland have been given a first vaccine against SARS-CoV-2, and over 661,000 have now received a second dose.
- The current UK variant of concern remains the dominant strain.

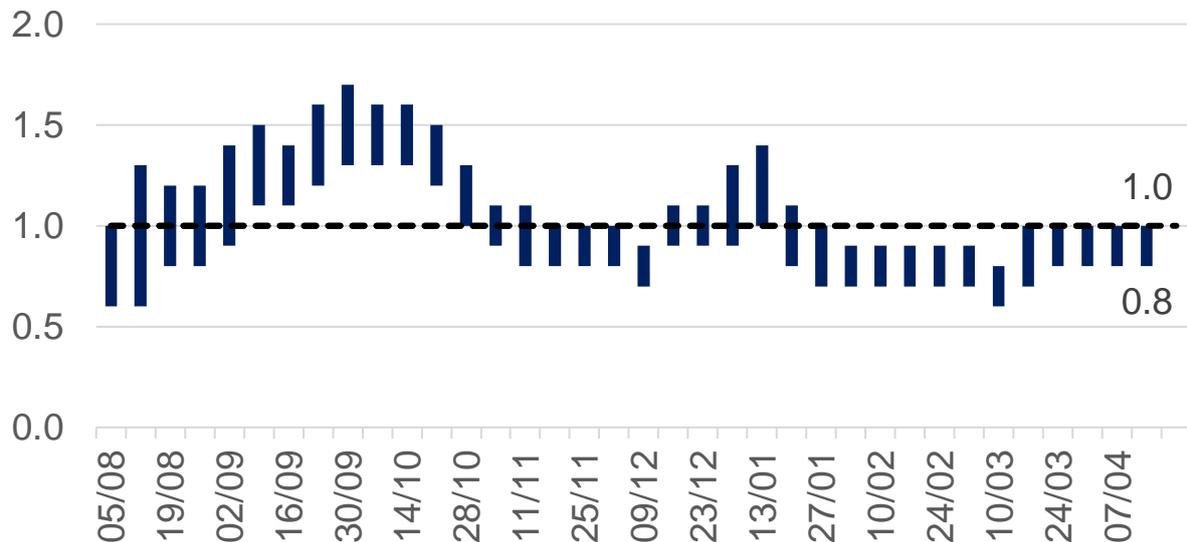

Method

This report brings together a wide range of publically available figures from a range of data sources. These include publications by Scottish Government, Public Health Scotland, National Records of Scotland, Office for National Statistics along with scientific publications and SAGE summaries where appropriate to summarise the state of the epidemic in Scotland in a given week. We also provide information on public attitudes to the virus from weekly You Gov polling surveys.

The national picture

The latest R value for Scotland (published on 15 April)² has remained the same this week and was between 0.8 and 1.0 (Figure 1), with a growth rate of between -4% and 0%.

Figure 1. R in Scotland over time

Since they were introduced in early January at a national level we have seen the impact of stay at home measures in reducing the level of SARS-CoV-2 in Scotland. An average of 250 cases were reported per day in the 7 days to 15 April, this is a 24% decrease from the daily average cases recorded a week earlier to 8 April³. Average daily cases reported are now around a tenth of the peak of 2,323 in the week to 7 January. Our current position is 34 weekly cases per 100,000 in the week to 12 April⁴. This compares to 302 weekly cases per 100,000 on 8 January and is similar to the weekly case rate observed on 21 September (see Figure 2)⁴.

The number of locations where the levels of Covid in wastewater are monitored has increased from 28 to 97 sites around Scotland. In contrast to COVID-19 case records, virus shedding into wastewater is a biological process. This means that wastewater data is unaffected by factors that impact whether testing is done. The overall level of

wastewater RNA was similar to last week, consistent with a slow decline in the rate of new cases.

Figure 2. Seven day case rate for Scotland by specimen date. Refers to PCR testing only.

Case rates in all age groups have decreased, with a sharpest decline in cases in those aged 60+ this week (Figure 3).

Figure 3. Seven day case rate in Scotland by age group by specimen date⁵. Refers to PCR testing only.

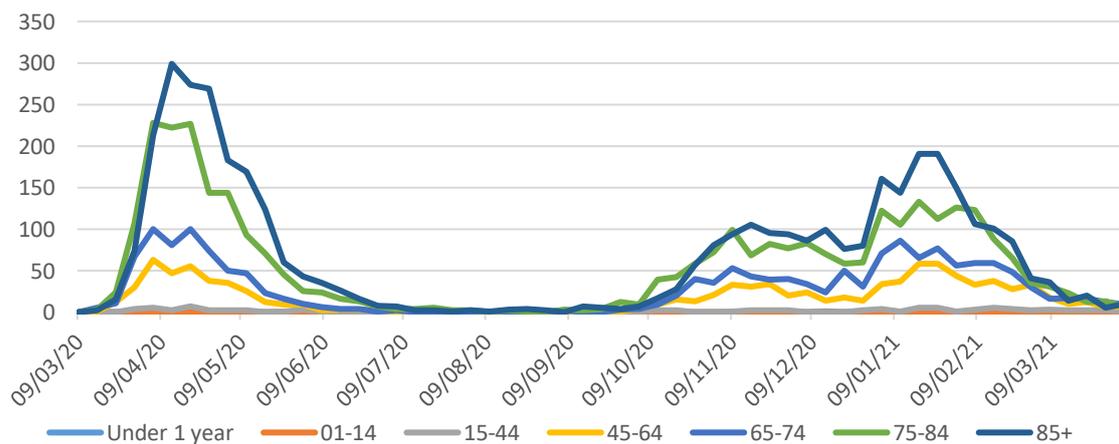

⁵ Source: Public Health Scotland

Not everyone who has the virus will be tested, as many people do not realise they have COVID, or have mild symptoms and do not come forward. Latest modelled estimates suggest there are currently anywhere between 200 and 1,500 people infected in Scotland each day². This means that as of 14 April there were between 4 and 28 new daily infections per 100,000 people.

The number of people in hospital with confirmed Covid for less than 28 days is declining. After peaking at 2,053 on 22 January, this figure has decreased and as of 8 April there were 115 patients in hospital with COVID-19. In addition, there was a fall in daily hospital admissions for people with Covid from a peak of 242 on 11 January to 10 on 11 April⁶.

There were 34 deaths registered where Covid was mentioned on the death certificate in the week to 11 April. This is an 11% decrease on the week before (38 deaths), and 95% lower than the peak in April 2020 (663 deaths). The proportion of deaths in care homes has decreased from 36% in mid-December to 15% of total deaths in the week to 11 April. However, this has increased from 9% in the week to 21 March. Deaths involving coronavirus have declined most in those aged 75-84 and have gone down by 70% in this age group over the 3 weeks to 11 April⁷ (Figure 4). Deaths in those aged 15-44, 65-74, 45-64 and 85+ have declined by 50%, 47%, 30% and 29% respectively over the same period.

Figure 4. Deaths by age group (weekly total by week beginning, NRS)⁷

⁷ NRS Scotland: <https://www.nrscotland.gov.uk/statistics-and-data/statistics/statistics-by-theme/vital-events/general-publications/weekly-and-monthly-data-on-births-and-deaths/deaths-involving-coronavirus-covid-19-in-scotland>

How Scotland compares with the rest of the UK

The latest ONS survey estimates that the proportion of the population infected in the community in Scotland (0.20% people currently testing positive for Covid-19 on 4 -10 April) has decreased slightly since last week and is now below England (0.21%), and above Northern Ireland (0.14%) and Wales (0.11%). In the week to the 10 April the estimated rate of community infection was 1 in 500 people in Scotland, compared to 1 in 480 for England, 1 in 920 for Wales and 1 in 710 for Northern Ireland⁸. Average daily deaths in Scotland (0.04 per 100,000 in the week to 15 April) are below Northern Ireland (0.07), but in line with England (0.04), and Wales (0.04). The Coronavirus Infection Survey estimated that in the week to 28 March, 46.0% of the population in Scotland would have tested positive for antibodies against Covid-19. This compares to 54.9% in England, 49.1% in Wales, and 54.5% in Northern Ireland⁹.

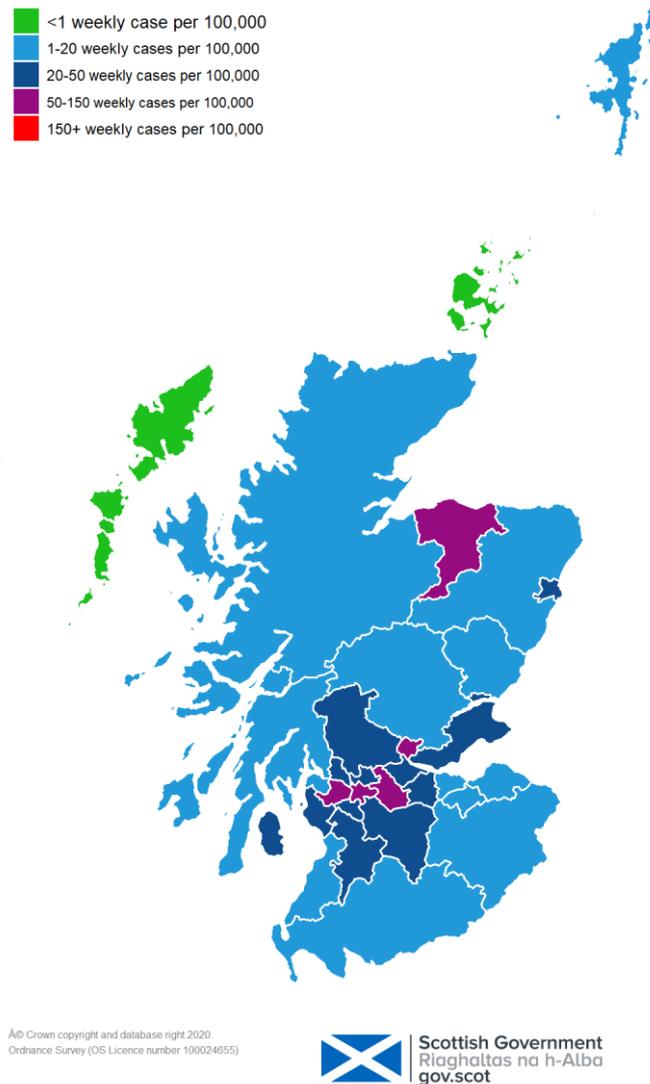

Situation by local authority within Scotland

Clackmannanshire currently has the highest case rates in Scotland with 81 weekly cases being reported per 100,000 in the week to 12 April. This is a decrease of 53% from the week to 5 April⁴. There are mostly moderate and low levels of cases across Scotland, with higher levels of cases observed across the central belt (Figure 5). Most Local Authorities recorded a fall in cases in the last week, however Moray saw a 75% increase in its case rates (from 29 to 51 weekly cases per 100,000) in the period of 5-12 April. Angus, Argyll and Bute, Dumfries and Galloway, Midlothian and Scottish Borders each have fewer than 10 weekly cases per 100,000. Na h-Eileanan Siar and Orkney each had 0 cases per 100,000 in the last week⁴.

Figure 5. Map of weekly new positive cases per 100,000 people in Scotland

The most recent modelling predicts that for the week ending 1 May, there are no local authorities with at least a 75% probability exceeding 50 cases per 100,000 population (Figure 6)².

Figure 6. Maps of probability of Local Authorities exceeding 50, 100, 300 and 500 cases per 100,000 population in the period 25 April – 1 May 2021¹⁰

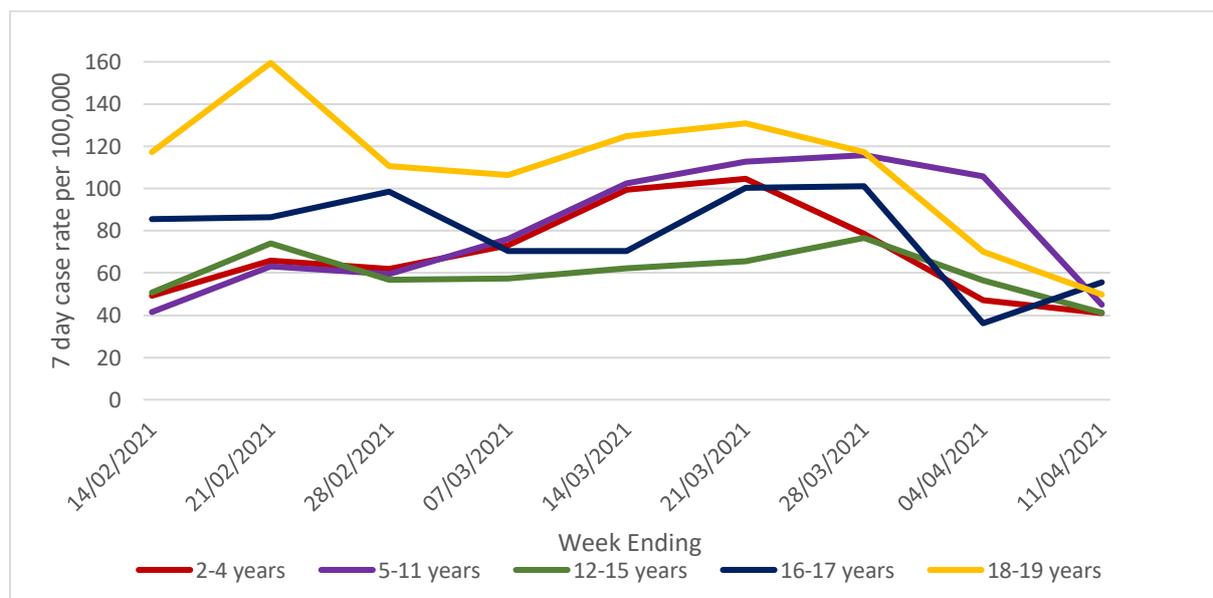

¹⁰ The local estimates should be interpreted with caution as they are based on fewer models than previous reports.

Children and Education

Children in early learning and childcare and those in primaries 1-3 went back to school or nursery on 22 February, and all children in primaries 4-7 went back on the 15 March. There has also been a phased return to secondary schools, with some Senior Phase (S4-S6) pupils returning to school on a part-time basis to attend practical lessons from the 22 February and all secondary school pupils (S1-S6) returning on a part-time basis from the 15 March. All children and young people are expected to return to full time education on the 12th or 19th April.

Over the last week there was a decrease in the total number of COVID-19 cases in children, which has gone down from 776 cases in the week to 4 April to 471 cases in the week ending 11 April. This is lower than in any week since September. The sharpest fall in 7 day cases per 100,000 was observed in those aged 5-11 (Figure 7)¹¹, with the highest proportion of cases still observed in those under 12 (258 cases). There has been a decrease in testing amongst most age groups in week ending 11 April, with a slight increase in those aged 16-17. Test positivity rates have increased in those aged 2-4, 5-11 and 16-17, however decreased in those aged 12-15 and 18-19 in the same period¹¹. Overall, the proportion of school, early learning and childcare settings with incidents remains low.

Figure 7. Seven day case rate in Scotland by age group by specimen date for children. Refers to PCR testing only.

¹¹ Public Health Scotland: [Dashboard - Data & intelligence from PHS \(isdscotland.org\)](https://isdscotland.org)

Looking ahead

Changes in patterns of mixing and adherence to restrictions will impact on future case numbers. The Scottish Contact Survey measures times and settings that people mix where they could potentially spread Covid². From this survey we can say that contacts are still higher than seen during the lockdown period (averaging around 3 daily contacts) but have decreased slightly in the last two weeks, with a current level of 3.5 daily contacts. Contacts within the work setting have shown a decrease in the last two weeks by 25% and 36% respectively, coinciding with spring holidays that commenced from 26th March. Mean contacts in the home setting have increased by approximately 16% over the same period. Those aged under 50 have shown a decrease in overall contacts whereas those aged 50 and over have increased their contacts. Although the older population have increased their contacts in the last two weeks, daily cases and deaths have declined over the same period.

Self-reported compliance with the current regulations and guidance has decreased since January but remains at a high level. On 13-14 April, 74% of people reported 'complete' or 'almost complete' compliance¹².

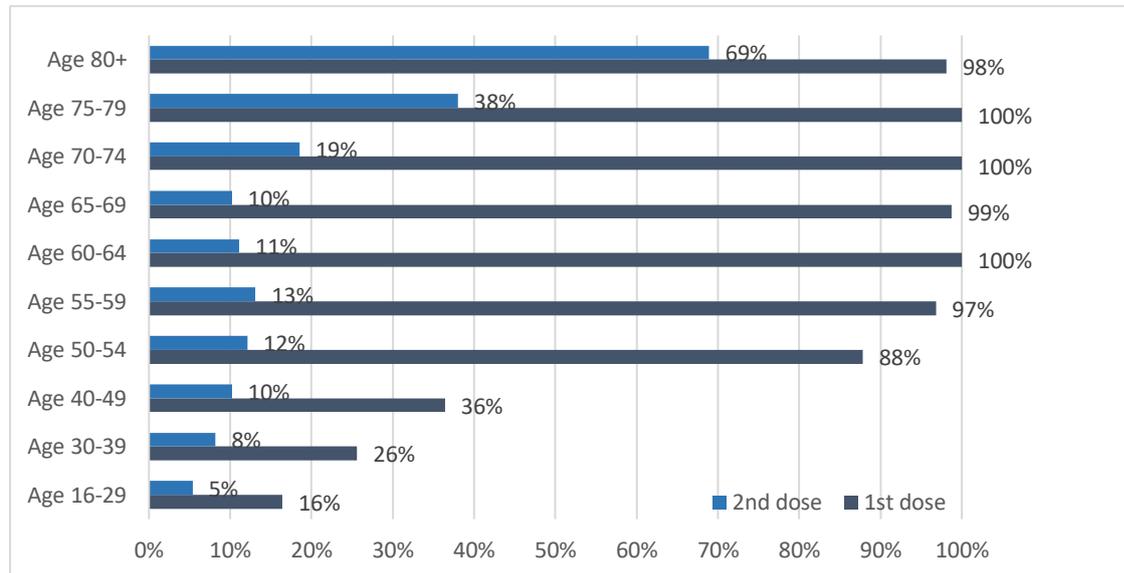

Hospital bed and ICU occupancy are projected to fall over the next few weeks, but these both may plateau or increase as a result of schools reopening and other relaxations of non-pharmaceutical interventions².

Vaccinations are continuing across the priority groups and almost 60% of the adult population in Scotland has now been vaccinated with the first dose⁴. The first vaccines were administered on Tuesday 8 of December and 2,708,691 had received their first dose by 15 April 2021, a 4% increase from the 8 April³. By the 15 April over 34,000 residents in care homes had received their first vaccination along with over 52,000 care home staff. In older adult care homes almost 90% of residents have now received their second dose. By age group, almost 100% of individuals aged 55+ and 88% of those aged 50-54 had received their first vaccination (Figure 8). 69% of the over 80s and 38% of those aged 75-79 have received their second dose. Overall, 661,975 (14.6%) of those aged 16 and had received their second dose by 15 April⁶. There

¹² Results are taken from questions run on behalf of Scottish Government on the YouGov online omnibus survey. The sample is demographically and geographically representative of adults 18+ across Scotland, with c.1000 responses each week. Fieldwork took place on 13-14 April with a total sample size of 1,011 adults. 'Complete' or 'almost complete' compliance refers to respondents who rated themselves 6 or 7 on a scale of 1-7 for the question: *Thinking about ALL of the guidance from the Scottish Government on what to do and what not to do during the Coronavirus pandemic (including distancing, protection measures and all restrictions)...On a scale of 1-7, where 1 is 'Not at all' and 7 is 'Completely', to what extent do you feel you are following the regulations and guidance?*

are continual decreasing hospitalisations and deaths among those groups vaccinated first (Figure 4).

Figure 8. Estimated percentage of people vaccinated by 15 April 2021

The proportion of people surveyed who said they would be likely to be vaccinated for COVID-19 remains high. 63% of all respondents have already received at least their first vaccine dose. Of those not vaccinated, 75% report they are likely to be vaccinated when a vaccine becomes available to them¹³.

How the virus is changing

The variant of the virus commonly known as the UK variant (VOC-20DEC-01) has been increasing its share of confirmed cases since it was first detected in Scotland in mid-December and is now the dominant strain¹⁴. This new variant of Covid is more transmissible¹⁵. It is likely that infection with this variant is associated with an increased risk of hospitalisation and death compared to infection with non-VOC viruses¹⁶.

Other variants of concern (VOCs) are being monitored by sequencing of SARS-CoV-2 samples. To date there are four VOCs and six variants

¹³ Total sample size on 13-14 April was 1,011 adults. Sample size for those who have not yet received their first vaccine was 330 adults. 'Likely' to be vaccinated refers to respondents who rated themselves 8 to 10 on a scale of 0-10 for the question: How likely or unlikely are you to be vaccinated for COVID-19 when a vaccine becomes available to you? (Please select a number between 0 and 10, where 0 means 'extremely unlikely' and 10 means 'extremely likely')

¹⁵ [Investigation of novel SARS-CoV-2 variant - Variant of Concern 202012/01 \(publishing.service.gov.uk\)](https://www.gov.uk/government/news/investigation-of-novel-sars-cov-2-variant-variant-of-concern-20201201)

¹⁶ [S1095_NERVTAG update note on B.1.1.7 severity 20210211.pdf \(publishing.service.gov.uk\)](https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/95411/S1095_NERVTAG_update_note_on_B.1.1.7_severity_20210211.pdf)

under investigation¹⁷. Up to 14 April, there have been 32 genomically confirmed cases of the variant VOC-20DEC-02 (first seen in South Africa) detected in Scotland. There have been 6 confirmed cases of the variant VOC-21JAN-02 (first identified from Brazil). There have also been a number of cases of other variants, which are currently under investigation, including 26 cases of B.1.525, first seen in Nigeria. There is some concern, that some of these new variants may partially escape immunity, from both natural infection and from vaccines currently being deployed, and we are monitoring the evidence on this^{18 19 20}.

Next steps

The Scottish Government continues to work closely with Public Health Scotland to monitor the course of the epidemic using several data sources. Each week this report will provide an overview of current COVID-19 situation in Scotland. This will include real time data on case rates, hospitalisations and deaths and how Scotland's figures compare to those from the rest of the UK. Modelling can tell us where the epidemic is likely to be heading. Local data and data by age group can highlight where problem arise, which can help in addressing some of these issues. In the coming weeks the roll out of the vaccine will continue to be monitored along with the impact of this on case rates and deaths among different age cohorts. Investigations are ongoing by NERVTAG, SPI-M, SAGE, Public Health England and Public Health Scotland regarding the impact of new variants and of vaccination, this will be reflected here as work is undertaken.
