Chapter 1
Methodology & response
1.1 INTRODUCTION

1.1.1 The Scottish Health Survey series

The Scottish Health Survey (SHeS) series was established in 1995 to provide data about the health of the population living in private households in Scotland. It was repeated in 1998 and 2003 and has been carried out annually since 2008.

The 2012-2015 surveys are being conducted by ScotCen Social Research and Medical Research Council Social and Public Health Sciences Unit (MRC SPHSU) in collaboration with the Centre for Population Health Sciences at the University of Edinburgh and the Public Health Nutrition Research Group at the University of Aberdeen.¹

1.1.2 Aims of the Scottish Health Survey

The purpose of SHeS is to provide information at the national level about the health of the population and the ways in which lifestyle factors are associated with health. This level of information is not available from administrative or operational databases, as hospitals and GPs are not able to collect detailed information about peoples’ lifestyles and health-related behaviours. In addition, it is crucial that the Scottish Government has information about the health of the population, including people who do not access health services regularly.

The specific aims of SHeS are:

- To estimate the prevalence of particular health conditions in Scotland
- To estimate the prevalence of certain risk factors associated with these health conditions and to document the pattern of related health behaviours
- To look at differences between regions and between subgroups of the population in the extent of their having these particular health conditions or risk factors, and to make comparisons with other national statistics for Scotland and the rest of Britain
- To monitor trends in the population’s health and health related behaviour over time
- To make a major contribution to monitoring progress towards health targets

Each year, the survey consists of a set of core questions and measurements (for example, anthropometric and, if applicable, blood pressure measurements and analysis of urine and saliva samples), plus modules of questions on specific health conditions. As with the earlier surveys in the series, the principal focus of the 2012-2015 surveys
remains cardiovascular disease (CVD) and related risk factors. CVD is one of the leading contributors to the global disease burden. Its main components are ischaemic heart disease (IHD) and stroke. IHD is the second most common cause of death in Scotland after cancer.\(^2\)

The SHeS series now has trend data going back 19 years; providing the time series is an important function of the survey.

### 1.1.3 Key changes to the survey methodology in 2012-2015

A number of changes to the survey methodology were proposed during the 2011 Scottish Government review of Scotland’s major household surveys. The key changes to SHeS introduced in 2012 for the 2012-2015 surveys were:

- Sample of addresses drawn by the Scottish Government
- Inclusion of a set of harmonised core questions asked across all major Scottish Government household surveys
- Reduction in the achieved sample size
- Discontinuation of a module of questions on Knowledge, Attitudes and Motivations (KAM) to health
- Introduction of interviewer administered biological samples and measurements to replace the nurse interview

These changes are discussed in greater detail in Volume 2 of the 2012 technical report.\(^3\)

### 1.1.4 The 2014 survey

The 2014 SHeS was designed to provide data at national level about the population living in private households in Scotland. The eligible age range for the survey was 0+.

An initial sample of 9,651 addresses was drawn from the Postcode Address File (PAF). These addresses were comprised of three sample types: Main (core) sample, child boost screening sample and Health Board boost sample. Ayrshire and Arran, Fife, Grampian and Western Isles NHS Health Boards opted to boost the number of adults (16+) interviewed in their area in 2014. The table below shows the number of addresses drawn for each sample type and the people eligible for interview within each sample type.

The 9,651 addresses were grouped into 436 interviewer assignments, with around 36 assignments being issued to interviewers each month between January 2014 and December 2014.
<table>
<thead>
<tr>
<th>Sample type</th>

<td><strong>9,651</strong></td>
<td></td>
</tr>
</tbody>
</table>

Data collection involved a main computer assisted interview (CAI), paper self-completion questionnaire, height and weight measurements and, if applicable, adults also completed the biological module. Of the 4,457 main addresses issued, 1,949 were flagged as eligible for the ‘biological module sample.’ At these addresses all adults (16+) that participated in the main interview were eligible to take part in the biological module. Only interviewers that were specially trained in administering biological measures and samples were allocated to work on these addresses.

### 1.1.5 The 2014 SHeS annual report

The 2014 report consists of two volumes, published as a set as ‘The Scottish Health Survey 2014.’ Volume 1 presents results for adults and children on a variety of health topics. This report (Volume 2) provides methodological information and survey documentation. Both volumes are available on the Scottish Government’s SHeS website along with a short summary report of the key findings from the 2014 survey (www.gov.scot/scottishhealthsurvey). Supplementary web tables are also available on the website.

### 1.1.6 Comparisons with previous surveys in the SHeS series

In the 2014 report comparisons are made with data collected earlier in the series (1995-2013). Having such an extensive trend period makes it possible to comment on whether any changes in health behaviours identified between years were real or an instance of sample fluctuation.

In addition, this report includes analysis of the 2012 and 2014 combined dataset and the 2012, 2013 and 2014 combined dataset. Combining data across years in this way allows for a more detailed analysis of subgroups in the sample and for questions with small sample sizes in one survey year – for example treatment of those with COPD, which was only asked of those with COPD, and respiratory conditions, questions on which are only asked on a biennial basis as part of the Core Version A rotating module. Tables in the report indicate whether
the figures presented are based on a single year’s data or combined
data from across survey years.

1.1.7 Health Board level analysis
Since 2008, the SHeS sample has been designed to be representative at the Health Board level (for all Boards) after four years of data collection have taken place. Analysis of the 2008 to 2011 data by NHS Health Board was published in 2012 and is available on the SHeS website (www.gov.scot/scottishhealthsurvey). The 2014 report does not include any analysis by NHS Health Board. Results for all health boards will be available in 2016 for the sample years 2012-2015 combined. Health Boards with larger samples may be able to analyse data at their Board level before this and users should consult the SHeS website for further guidance on sub-geographies analysis. Changes in the sample design between 2008-2011 and 2012-2015 mean that users are not advised to combine data outwith the four-year cycles from which they have been drawn.

1.1.8 Access to SHeS data
Data from the 2014 survey will be deposited at the UK Data Service along with a combined 2012/2014 dataset and a combined 2012/2013/2014 dataset. Datasets from earlier years in the series are also deposited here (www.data-archive.ac.uk).

1.2 SAMPLE DESIGN

1.2.1 Requirements
The sample specification for the 2012-2015 Scottish Health Survey (SHeS) was designed by the Scottish Government. The design was coordinated with the designs for the Scottish Household Survey and the Scottish Crime and Justice Survey as part of a survey efficiency project and to allow the samples of the three surveys to be pooled for further analysis.4

There were three elements to the SHeS sample in 2012-2015:

1) Main adult sample - to allow annual reporting of Scotland level results and results at Health Board level at the end of the 2012-2015 four year cycle. This required an annual interview target of 4,006 adults for Scotland as a whole and a minimum of 125 for each Health Board. There was an additional requirement for a minimum of 1,000 adults to complete a biological module each year.

2) Child sample boost – overall there was a requirement for 1,785 child interviews for Scotland. As the main sample was only expected to yield 780 child interviews, a further 1,005 interviews were required from a separate boost sample.
3) Health Board boosts – in 2014, Ayrshire and Arran, Fife, Grampian and Western Isles Health Boards commissioned boosts to increase the number of adult interviews in their Board area. Each of the Health Boards specified the target number of interviews for their boost.

1.2.2 Sample design and assumptions
For all three elements a two-stage clustered sample design with intermediate geographies randomly selected at the first stage and address points at the second stage, was used. With the exception of Orkney, Shetland and Eilean Siar, the sample was clustered by intermediate geographies (IG) with one quarter of IGs selected for each year of fieldwork. This means that over four years of fieldwork all IGs are included in the sample and the combined 2012-2015 sample is unclustered.

1.2.3 Main sample
As stated above, the annual sample size for Scotland was 4,006 adults with a minimum Health Board sample size of 125 adults. These sample sizes were the minimum required to allow effective reporting of Scotland-level results annually and Health Board results at the end of the four year cycle. An iterative approach was taken to efficiently allocate the sample across all Health Boards. For the first iteration 4,000 adult interviews were allocated across Health Boards in proportion to the adult population. Any Health Boards allocated fewer than 125 adult interviews had their allocation increased to 125.

The remaining sample was then allocated over the remaining Health Boards. Where allocations were not whole numbers the number was rounded up. This resulted in a total target of 4,006 adult interviews. The results of the allocation are shown in Figure 1A.

</table>

While the required sample sizes were set at Health Board level, to allow for coordination with the sample selection of the SHS and SCJS, the sample design was implemented using Local Authorities as strata. This was done by allocating the target Health Board samples to Local Authorities proportionate to population.

There was a slight complication in the design due to Local Authority boundaries not being concurrent with Health Board boundaries prior to April 2014, which were used for sampling purposes. Where there were fewer than 2% of the Local Authority population outwith its main Health Board, it was assumed that the Local Authority was entirely located within the Health Board. This gave the following assumptions:

- Dumfries and Galloway LA lies completely in Dumfries and Galloway HB
- Perth and Kinross LA lies completely in Tayside HB
- Scottish Borders LA lies completely in Borders HB
- Falkirk LA lies completely in Forth Valley HB
- East Renfrewshire LA lies completely in Greater Glasgow and Clyde HB
- Glasgow City LA lies completely in Greater Glasgow and Clyde HB
- Stirling LA lies completely in Forth Valley HB
- West Lothian LA lies completely in Lothian HB.

For North Lanarkshire and South Lanarkshire 5.6% and 22.3% of the respective populations were located in Greater Glasgow and Clyde Health Board rather than Lanarkshire Health Board. Therefore, the sample stratification for the North Lanarkshire and South Lanarkshire Local Authority areas were each split into two with the west elements.
lying in Greater Glasgow and Clyde and the east elements lying in Lanarkshire.

The number of addresses selected in order to provide the target number of interviews was calculated by:

1) Estimating the number of productive adult interviews per co-operating household. Based on response data to the 2008 and 2009 surveys, it was estimated that for Greater Glasgow and Clyde there would be 1.5 interviews per co-operating household, with 1.55 interviews in all other Health Boards.

2) Allocation of the target interviews and associated estimate of co-operating households to Local Authority strata proportionate to population.

3) As the sample was stratified by Local Authorities, the response rates from the previous surveys were examined. It was found that sample sizes for individual authorities were too small to base response assumptions on. It was also found that it would be inappropriate to base assumptions on Health Boards as there was a high degree of variability for Local Authorities within the same Health Board. Therefore, Local Authorities were placed in 9 groups which had common attributes and comparable response rates. The response rate assumptions for the Local Authority groups for 2014 were then based on the weighted average of responses for 2010, 2011 and 2012. Figure 1B below shows the Local Authority groupings.

4) The final step was to estimate the level of ineligible addresses. The estimates were calculated at Local Authority level and based on the average level of ineligible addresses from the Scottish Health Survey, Scottish Household Survey, Scottish Crime and Justice Survey, and Scottish House Condition Survey from 2007 to 2009/2010.

Figure 1E shows the number of selected addresses for the main sample in 2014.

1.2.4 Child boost sample

For the 2012-2015 surveys, 1,785 child interviews were required each year. Based on the 2009 survey, it was estimated that the main sample would provide 780 child interviews, therefore, to reach the target number of child interviews, a child boost sample was required to yield a further 1,005 interviews.

While the target number of child interviews was specified at Health Board level, as with the main sample, the child boost sample was also stratified by Local Authority. The process for calculating the number of addresses to select for the child boost sample was as follows:

1) The overall target sample of 1,785 child interviews was allocated proportionally to Health Boards based on the child (under 16) population. The expected number of child interviews from the main sample was then subtracted from the overall target sample to obtain the child boost target sample for Health Boards. If the number expected from the main sample was greater than the overall required number of child interviews for a Health Board then the boost target was set to zero and the remaining sample was redistributed so the overall target remained 1,785. The following table shows the target sample sizes for the main sample and child boost sample by Health Board.

<td><strong>Total</strong></td>
<td><strong>780</strong></td>
<td><strong>1005</strong></td>
<td><strong>1785</strong></td>
</tr>
</tbody>
</table>

2) The number of co-operating households with children required in each Health Board for the child boost sample was estimated using the performance of the child boost sample in the 2008 and 2009 surveys.

3) To estimate the proportion of child-less households data from the 2007-2008 Scottish Household Survey was used. As there was little variation across different areas a Scotland level estimate of households without children (74.6%) was used.

4) Analysis of survey response to the child boost samples in the 2008 and 2009 surveys found that the response rate was consistently higher for the child boost than the main sample. Therefore, for each Local Authority area, the estimated response rates for the child boost sample were set at 6% higher than the main sample response rate.

5) The assumptions made on ineligible addresses for the main sample were applied to the address calculations for the child boost sample.

The total number of addresses selected for the child boost sample are shown in Figure 1E.
1.2.5 Health Board boost samples

Each year individual Health Boards are given the opportunity to fund a boost sample to enable them to boost the number of adult interviews in their Board area. For the 2014 survey, Ayrshire and Arran, Fife, Grampian and Western Isles opted to boost the main sample in their areas. The following table shows the target sample size for each of the boosts.

**Figure 1D: Target sample for Health Board boosts in 2014**

</tr>
<tr>
<td>Western Isles</td>
<td>100</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>1000</strong></td>
</tr>
</tbody>
</table>

As the main sample was selected before boost areas were confirmed, boost samples were supplementary to the main sample. For Ayrshire and Arran, Grampian and Western Isles the sample design followed the process outlined above for the main sample. Fife Health Board requested that the combined main sample and boost sample was equally distributed across its three Community Health Partnership areas. This required an extra level of stratification for Fife before the process above could be followed. For the boost samples the same active PSUs as the main sample were used.

1.2.6 Sample Selection

The Royal Mail’s small user Postcode Address File (PAF) was used as the sample frame for the address selection. The advantages of using the PAF are as follows:

- It has previously been used as the sample frame for Scottish Government surveys so previously recorded levels of ineligible addresses can be used to inform assumptions for 2014 sample design
- It has excellent coverage of addresses in Scotland
- The small user version excludes the majority of businesses.

The Assessor’s Portal, the council tax list of all dwellings in Scotland, was considered as an alternative sample frame but since it had not previously been used as a sample frame for large scale surveys in Scotland there would have been a greater risk attached to assumptions for response rates and ineligible addresses.

The PAF does still include a number of ineligible addresses, such as small businesses, second homes, holiday rental accommodation and vacant properties. A review of the previous performance of individual surveys found that they each recorded fairly consistent levels of ineligible address for each Local Authority. This meant that robust assumptions could be made for the expected levels of ineligible addresses in the sample size calculations.

As the samples for the SHS, SHeS and SCJS have all been selected by the Scottish Government since 2012, addresses selected for any of the surveys are removed from the sample frame so that they cannot be re-sampled for another survey. This helps to reduce respondent burden. The addresses are removed from the sample frame for a minimum of 4 years.

The sample design specified in Section 1.2 was implemented in three stages:

1) All primary sampling units (datazones on the islands, intermediate geographies elsewhere) were randomly allocated to one of the four years of fieldwork. This meant that the sample was drawn from one quarter of PSUs each year and ensured that over four years (2012 to 2015) of fieldwork all addresses had a non-zero probability of selection. One quarter of target adult sample was required to complete the biological module. To make fieldwork more efficient, rather than randomly allocating addresses from the entire survey to the module, each year PSUs were allocated to the biological module and all selected addresses within those PSUs were eligible for the biological interview. To guard against a lower response rate to the different elements of the biological module, and to correct for inaccurate response assumptions in previous years, a proportion higher than
the required one quarter of PSUs (43.7% in 2014) were allocated to the biological module.

2) The required number of addresses for the main sample and child boost sample were combined to give an overall total of addresses to sample for each stratum (local authorities plus Lanarkshires split). The overall number of addresses for each stratum was then sampled from the sample frame of addresses in active PSUs. Systematic random sampling was used with addresses within PSUs ordered by urban-rural classification, SIMD rank and postcode.

3) Once the overall sample was selected, each address was randomly allocated to the main sample or the child boost sample.

1.2.7 Selecting households at addresses with multiple dwellings

A small number of addresses have only one entry in the Postcode Address File (PAF) but contain multiple dwelling units. Such addresses are identified in the PAF by the Multiple Occupancy Indicator (MOI). To ensure that households within MOI addresses had the same probability of selection as other households, the likelihood of selecting the addresses was increased in proportion to the MOI. At addresses with more than one dwelling unit fieldworkers have a programme to randomly select the household at which interviews should be sought. There are generally a few cases where the MOI on the PAF is inconsistent with the actual number of dwelling units. When this occurred the fieldworkers recorded the information and a correction was made through the survey weighting.
1.2.8 Selecting individuals within households

For both the main and Health Board boost samples all adults aged 16 and over in responding households were selected for interview. To ease respondent burden, for child interviews for both the main sample and the child boost sample a maximum of two children were interviewed at each household. If a household contained more than two children then two were randomly selected for interview.

1.3 TOPIC COVERAGE

1.3.1 Introduction

The most recent consultation on the content of the SHeS questionnaire was carried out in 2011, ahead of the 2012-2015 surveys. Many of the topics included in previous years are being included again in the 2012 to 2015 surveys. The 2014 survey included the same topics as the 2012 survey. As with previous years, the survey had a focus on cardiovascular disease (CVD) and its associated risk factors.

1.3.2 Documentation

Copies of all the documents used in data collection are included in Appendix A. Full copies of the questionnaire documentation used in the main interview and biological module are also included in Appendix A. Protocols for taking measurements (height, weight, waist and blood pressure) and collecting biological samples (saliva and urine) are included in Appendix B. A summary of the main interview content and the content of the biological module is provided below.

1.3.3 Main interview

Information was collected at both the household and individual level. The table that follows summarises the content of the individual level interviews for all participants. The topics a participant was asked depended both on their age and the sample type to which their address had been allocated to. The age criteria for each topic is included in brackets after the topic name.

Version A households accounted for 55-60% of the main (core) sample. At these households the questionnaire included the core questions and the questions included in the Version A rotating module. In 2014, the topics included in the Version A rotating module were: respiratory health, additional questions on asthma, and a series of questions on eating habits for adults.

Version B households accounted for the remaining 40-45% of the main (core) sample. At these addresses participants were only asked the core questions during the main interview with participating adults (aged 16+) also eligible to complete the biological module.

A significant number of changes were made to the questionnaire content in advance of the 2012 survey based on the 2011 consultation. These changes are discussed in the 2012 Technical Report³ and the SHeS Questionnaire Review Report 2012-2015.⁵

In addition, a number of questions were introduced to the questionnaire in 2014.

Three new questions were added to the face-to-face element of the questionnaire:
• Two questions about the use of electronic cigarettes were included
• One question about the impact of the 2014 Glasgow Commonwealth Games on motivations to take part in physical activity or sport was included

Two questions, last included in 2010, were also reinstated for 2014:
• A question which asked about the places where people do physical activity
• A second question asked about the frequency of using particular places for physical activity

Some additional questions were also added to the self-completion booklet element of the interview. They were only included in the self-completion booklet completed by parents of 4-12 year olds and were an extension of the Strengths and Difficulties Questionnaire. The questions asked about difficulties in the areas of emotions, concentration, behaviour or being able to get on with other people.

The full question wording of all the questions can be found in Appendix A.

1.3.4 Self-completion questionnaire

Participants aged 13 and over and parents of participants aged between 4 and 12 were asked to fill in a self-completion booklet during the interview. In all, four different booklets were administered. The version completed was dependent on the age of the participant.

The booklet for young adults aged 16-17 included questions on smoking and drinking behaviour (instead of being asked as part of the CAPI interview). Interviewers also had the option of using this young adults booklet for those aged 18-19 if they felt that it would be more appropriate for them to answer the questions in this format rather than face to face (e.g. might be more likely to give more honest answers than in the face to face interview when other household members including parents may be present).

Paper questionnaire booklets were administered for the following groups in the 2014 survey:

Adults AUDIT questionnaire (designed to identify signs of hazardous or harmful drinking or possible alcohol dependence), General Health Questionnaire 12 (GHQ12), Warwick Edinburgh Mental Well-being scale (WEMWBS), gambling, use of contraception, knowledge of the physical activity recommendations and sexual orientation

Young adults Smoking, drinking, AUDIT questionnaire, GHQ12, WEMWBS, gambling, use of contraception,
knowledge of physical activity recommendations and sexual orientation

13-15 year olds
GHQ12, WEMWBS and knowledge of the physical activity recommendations

Parents of 4-12 year olds
Strengths and Difficulties questionnaire (SDQ) designed to detect behavioural, emotional and relationship difficulties in children and knowledge of the physical activity recommendations.

1.3.5 Height and weight

Interviewers measured the height and weight of all participants aged 2 and over if they agreed. Protocols for taking height and weight measures are included in Appendix B.

1.3.6 Biological module

As highlighted previously, at a sub-sample (of around 40-45%) of main core sample addresses, adults (aged 16 and over) were eligible to complete the biological module. From 2012 to 2015, specially trained interviewers are collecting some of the measurements and samples which were collected by nurses prior to 2012.

Since the same interviewer administered the main interview and the biological module, the latter could either be completed immediately after the main interview or on a separate occasion.

As part of the module, participants were asked whether they used any medicines, pills, syrups, ointments, puffers or injections prescribed to them by a doctor or nurse. If participants answered yes to questions in the main interview about taking medication for high blood pressure, a heart condition or stroke then they would be asked to give the names of the drugs to the interviewer. This information is used to interpret blood pressure readings.

In addition to height and weight measurements, interviewers also took the following measurements from participants taking part in the biological module: blood pressure and waist circumference. Written agreement was also sought to take samples of saliva (for the analysis of cotinine, a derivative of nicotine) and spot urine samples (for the analysis of dietary sodium).

Participants were also asked a set of questions about depression, anxiety, suicide attempts and self-harm (taken from the Adult Psychiatric Morbidity Survey) in computer assisted self-interviewing (CASI) format.

1.4 FIELDWORK PROCEDURES

1.4.1 Advance letters

Each sampled address was sent an advance letter that introduced the survey and stated that an interviewer would be calling to seek permission to interview. Three versions of the advance letter were used in 2014; one for the core version A and Health Board boost addresses, one for the core version B (with the biological module) addresses, and a separate version was sent to child boost addresses. A copy of the survey leaflet was included with every advance letter. The survey leaflet introduced the survey, described its purpose in more detail and included some summary findings from previous surveys. Copies of the letters and leaflet are included in Appendix A.

1.4.2 Making contact

At initial contact, the interviewer established the number of dwelling units (DUs) and/or households (HHs) at an address and made any necessary selections (see Section 1.2).

The interviewer then attempted to make contact with each household. In the main sample they attempted to interview all adults (up to a maximum of ten) and up to two children aged 0-15 (see Section 1.2). At child boost sample households, interviewers first screened for children aged 0-15. In households where children were present up to two children were randomly selected for interview. Interviewers obtained the verbal consent of both the parent/guardian and the child before commencing the interview. At Health Board boost sample households interviewers attempted to interview a maximum of ten adults at selected households. Children were not eligible for interview at Health Board boost addresses.
1.4.3 Collecting data

Interviewers used computer assisted interviewing (CAI).

At each co-operating eligible household (across all sample types), the interviewer first completed a household questionnaire, with information collected from the household reference person or their partner wherever possible. This questionnaire obtained basic information (including date of birth and relationship to other household members) about all members of the household, regardless of age and whether or not they were eligible to take part in the interview. The CAPI program then created individual questionnaires for each eligible participant in the household.

Where possible an individual interview was then carried out with all eligible adults and children in a household. In order to reduce the amount of time spent in the home, interviews could be carried out concurrently, with the program allowing up to four participants to be interviewed in a single session.

Height and weight measurements were obtained towards the end of the interview.

In addition to an advance letter and general survey leaflet, participants were also given a more detailed leaflet describing the contents and purpose of the interview. Adults in households eligible for the biological module were given a longer version of this leaflet, providing information on the measurements and samples being taken.

A separate version of this leaflet was used for children in main and child boost households. Parents at child boost addresses were also given a leaflet containing background information on the survey. Copies of all the participant leaflets used in the survey are included in Appendix A.

1.4.4 Introducing the biological module

Only a sub-sample of adults in the main sample was eligible to take part in the biological module. At the end of the main interview, adult participants in Version B addresses were given a Measurement Record Card which included additional information about the measurements and samples collected in the biological module. Wherever possible, interviewers would complete the module directly after the main interview to minimise attrition. If this was not possible then the interviewer would arrange to go back at a convenient time to complete the module. The module included the measurements described in Section 1.3.6. Written consent was obtained from participants before saliva and urine samples were taken. The consent statements are included in Appendix A.

1.4.5 Interviewing and measuring children

Children aged 13-15 were interviewed directly by interviewers, after verbal consent had been obtained from both the child and their parent and/or guardian. Interviewers were instructed to ensure that the child’s
parent or guardian was present in the home throughout the interview. Information about younger children (aged 0-12) was collected directly from a parent/guardian. Whenever possible, younger children were present while their parent/guardian answered questions about their health. This was partly because the interviewer had to measure their height and weight and it also ensured that the child could contribute information where appropriate.

1.4.6 Feedback to participants

If participants wished, interviewers recorded height and weight measurements on their measurement record card.

Participants eligible for the biological module were given the Measurement Record Card for reference. If participants had their waist measurement and blood pressure taken then interviewers recorded their results on this card (if the participant wished).

Interviewers were issued with a set of guidelines to follow when commenting on participants' blood pressure readings (see Appendix B for details). If an adult's blood pressure reading was severely raised, interviewers were instructed to contact the Survey Doctor at the earliest opportunity. The Survey Doctor would then phone the participant and advise them to contact their GP as soon as possible.

1.5 FIELDWORK QUALITY CONTROL AND ETHICAL CLEARANCE

1.5.1 Training interviewers

Interviewers were fully briefed on the administration of the survey, including screening for households with children for the child boost sample. They were also trained and accredited in measuring height and weight.

Interviewers who had not previously worked on SHeS were accompanied by an interviewer supervisor during the early stages of their work to ensure that interviews and protocols were being correctly administered.

Interviewers interested in administering the biological module were initially screened for suitability. Minimum competency levels were set and only interviewers that met the set criteria were invited to training and accreditation sessions.

Training to administer the biological module took place over three days. At the end of the training session interviewers were accredited on administering each of the measurements and samples and were only able to work on the module if they passed their accreditation.

Interviewers were also accompanied by a nurse supervisor (with previous experience of working on the survey) on their initial biological
module visit. They are also supervised in the field annually by an experienced survey nurse to ensure they are administering the measurements and samples in line with SHeS protocols. Interviewers are reaccredited annually by the research team.

Full sets of written instructions, covering both survey procedures and measurement protocols, were provided to interviewers (Appendix B contains a copy of the measurement protocols).

1.5.2 Checking interviewer and measurement quality

A large number of quality control measures were built into the survey to check on the quality of interviewer performance at both the data collection stage and subsequently. Recalls to check on the work of interviewers were carried out at 10% of productive households.

The computer program used by interviewers had in-built soft checks (which can be suppressed) and hard checks (which cannot be suppressed) which included messages querying uncommon or unlikely answers as well as answers entered which fell outside a pre-determined acceptable range. For example, if someone aged 16 or over had a height entered in excess of 1.93 metres, a message asked the interviewer to confirm that this was a correct entry (a soft check), and if someone said they had carried out an activity on more than 28 days in the last four weeks the interviewer would not be able to enter this (a hard check). For children, some checks were age specific. Some young children were weighed by having an adult hold them; the weight of the adult on their own was entered into the computer followed by the combined weight of the infant and child. A hard check was used to ensure that the weight entered for the adult alone did not exceed the weight of the infant and adult combined.

1.5.3 Ethical clearance

Ethical approval for the 2013-2015 surveys was obtained from the Multi-Centre Research Ethics Committee for Wales (REC reference number: 12/WA/0261).

1.6 SURVEY RESPONSE

1.6.1 Introduction

This section presents the fieldwork outcomes for the sampled addresses. Survey response is an important indicator of survey quality as non-response can introduce bias into survey estimates. Standardised outcome codes (based on an updated version of those published in Lynn et al (2001)) for survey fieldwork were applied across the SHeS, SHS and SCJS. This enables consistent reporting of fieldwork performance and effective comparison between the performance of the surveys.
1.6.2 Household response

Table 1.1 shows a detailed breakdown of the SHeS response for all sampled addresses for Scotland in 2014. Addresses with unknown eligibility have been allocated as eligible and ineligible proportional to the levels of eligibility for the remainder of the sample. This approach provides a conservative estimate of the response rate as it estimates a high proportion of eligible cases amongst addresses with unknown eligibility.

At each selected household in the main sample all adults and a maximum of two children were eligible for interview. When considering the household response rate, households classed as “responding” were those where at least one eligible person was interviewed. The table shows that for the combined main and Health Board boost sample 62.2% of eligible households were classed as responding with all individual interviews complete at 51.0% of households.

For the child boost sample around three-quarters of households were ineligible as they did not contain any children under the age of 16. For eligible households 67.6% were classed as responding, with almost all interviews being completed in the responding households.

Table 1.2 shows that across Heath Boards the household response rate ranges from 53.0% (Lothian) to 74.0% (Orkney). Fully cooperating households were those where all eligible individuals were interviewed, all height and weight measured and, if eligible, completed the biological module. The definition of a fully cooperating household changed in 2012 and is therefore not comparable with fully cooperating figures prior to this.

Table 1.3 shows that the household response rate for eligible addresses in the child boost sample varied from 60.0% (Tayside and Lanarkshire) to 83.0% (Borders).

1.6.3 Individual response for adults

Overall there were 4,659 adult responses to the 2014 SHeS with 1,304 responses to the biological module, detailed in Table 1.4.

In order to calculate the adult response rate, since all adults in households were eligible for interview, the number of adults in non-responding households had to be estimated to calculate the total number of adults in all households. This was undertaken by calculating the average number of men and women per household for responding households and non-responding households (where information on the composition is known) and applying this to the households where nothing is known. The total estimated number of adults from sampled addresses eligible for interview is referred to as the “set” sample. For 2014 the set sample of men was 3,938 and for women 4,404.

Table 1.4 shows the adult response rate broken down by gender. The adult response rate was 53% for men, 59% for women and 56% overall.
In responding households (those households where at least one interview was completed) additional information on respondents allowed the consideration of response to stages of the survey by gender and age group. This is shown in Tables 1.5 and 1.6. For both men and women the younger age groups were found to have a lower response rate (66% for men aged 16 to 24 and 78% for women aged 16 to 24) than older age groups (90%+ response rate for men over 65 and for women over 25).

As part of the biological module, respondents were asked to have their waist and blood pressure measured and to provide saliva and urine samples. Almost all individuals completing the biological module interview allowed the waist and blood pressure measurements to be taken but there was a drop off in providing the samples. Of those eligible for the biological module (including non-responders to the main interview), 40% of men participated in the module (39% provided waist measurements, 39% blood pressure measurements, 38% a saliva sample, and 35% a urine sample), as did 46% of women (44% with waist measurements, 43% blood pressure, 42% saliva, and 39% urine).

Table 1.9 shows that men are under-represented in the SHeS sample compared to NRS population estimates as they made up 44% of the sample but 48% of the population. Younger age groups were also under-represented in the SHeS sample when compared to NRS population estimates. In particular, men and women under 25 were under-represented. Conversely, men and women over 65 were over-represented in the sample. 

1.6.4 Individual response for children (0-15)

Interviews were undertaken with 1,668 children aged 0 to 15, with 810 interviews taking place as part of the main sample and 858 as part of the child boost.

As was the case with the adult sample, in order to calculate the response rate for children, the number of eligible children in selected households (the “set” sample) had to be estimated. This was done by assuming that, for both the main sample and the child boost sample, the non-responding and responding households contained the same average number of children.

Table 1.7 shows that overall response rates for both the main sample and the child boost sample were similar for boys and girls with a response rate of 60-61% for the main sample and 68-69% from the child boost sample.

Child response rates have also been calculated for children in responding households. Table 1.8 shows that for age groups under 11 years old the response rate for boys and girls was fairly consistent at over 96% for every group, however, the response rate for children aged 11 to 15 was slightly lower at 93% for both boys and girls.
1.7 WEIGHTING THE DATA

1.7.1 Introduction

This section presents information on the weighting procedures applied to the survey data. Since 2012 the weighting for SHeS has been undertaken by the Scottish Government rather than the survey contractor (as had previously been the case), but the methodology applied was largely consistent with that of the 2008 to 2011 sweeps of the survey. The procedures for the implementation of the weighting methodology were developed by the Scottish Government working with the Methodology Advisory Service at the Office for National Statistics.\(^8\)

To undertake the calibration weighting the ReGenesees Package for R was used and within this to execute the calibration a raking function was implemented.

1.7.2 Main adult weights

The main adult weight is applicable for all adults interviewed as part of the main sample and the health board boosts. There were six steps to calculating the overall adult weights. These were as follows:

1) Address selection weights (w1)

The address selection weights were calculated to compensate for unequal probabilities of selection of addresses in different survey strata. For the main sample with the health board boost there were 36 strata overall (one for each local authority, an extra strata for the Lanarkshires and two extra strata in Fife as a result of the boost). The address selection weight for each stratum was calculated as:

\[
 w_1 = \frac{\text{Number of PAF addresses in the stratum}}{\text{Number of addresses selected for the stratum}}
\]

2) Dwelling unit selection weights (w2)

As stated in Section 1.2.7, the MOI for the PAF was used to ensure that if there were multiple dwelling units at a single address point then they would have the same selection probability as individual addresses. However, there were some cases where the MOI was incorrect. The following correction was applied where this was the case:

\[
 w_2 = \frac{\text{Recorded dwelling units at the address}}{\text{PAF MOI for the address}}
\]

With w2 trimmed to a maximum of 3.

3) Household selection weights (w3)

Similarly, within a very small number of dwelling units fieldworkers found multiple households, of which only one was selected for
participation in the SHeS. The following correction was applied for multiple households:

\[ w3 = \text{Number of households within dwelling unit} \]

With \( w3 \) trimmed to a maximum of 3.

4) Calibrated household weights (w4)

The three selection weights were combined \((w1 \times w2 \times w3)\) before the household calibration stage. This combined weight was applied to the survey data to act as entry weights for the calibration. The execution of the calibration step then modified the entry weights so that the weighted total of all members of responding households matched the population totals for Health Boards, Scotland-level population totals for age/sex breakdown, and the population within SIMD15 areas. The population totals that were used were the National Records of Scotland’s (NRS) mid-2013 estimates for private households.

5) Adult non-response weights (w5)

All adults within selected households were eligible for interview, but within responding households not all individuals completed an interview. The profiles of household members that did not complete the interview were different from those that do. Information on all individuals within responding households was available through information gathered as part of the household interview. This allowed the differential response rates for individuals within households to be modelled using logistic regression to calculate a probability of responding based on their profiles. The logistic regression was only applicable for households containing more than one adult since households consisting of only one adult either responded to the household and individual interviews or did not respond at all.

The following variables were considered for inclusion in the model:

- Health Board
- Age/sex
- Number of adults in the household
- Employment status of household reference person
- Presence of a smoker in the household
- Frequency of eating meals together
- Marital status
- Tenure
- Urban/rural classification
- Access to a car
- Located within SIMD15 area
Through running backwards and forwards selection procedures for the logistic regression the following variables were included in the final model:

- Health Board
- Age/sex
- Number of adults in the household
- Frequency of eating meals together
- Marital status
- Tenure
- Located within SIMD15 area

The final logistic regression model was then used to calculate the probability of response for all individuals that did respond. The adult non-response weight (w5) was then calculated as the reciprocal of this probability:

\[ w_5 = \frac{1}{\text{Probability of individual's response}} \]

For households of only one adult the non-response weight was one.

6) Individual calibration and final adult weight (int14wt)

The household (w4) and non-response (w5) were combined (w4* w5) and applied to the survey data prior to the final stage of calibration weighting which matched weighted totals for the survey data to the NRS 2013 mid-year population estimates for Health Boards, age/sex distribution at Scotland level and age/sex distribution for the Glasgow and Greater Clyde Health Board.

1.7.3 Biological module weights

A similar process was applied to derive the weights for the biological module. This is outlined below.
1) Address selection weight (bw1)
New address selection weights were calculated using the same process as described for w1 but with the Health Board boost addresses excluded.

2) Dwelling unit (w2) and household selection weights (w3)
The dwelling unit and household selection weights from the main adult weight were applied as above.

3) Calibrated household weight (bw4)
The three selection weights were combined (bw1*w2*w3) and applied to the survey data before the household calibration was run so that survey data matched the population totals for Health Boards, Scotland-level age/sex breakdown, and the population within SIMD15 areas.

4) Adjustment for biological module selection (bw5)
43.7% of the main sample was allocated to the biological module. To incorporate this probability of selection a correction was applied to the calibrated household weight (bw4). The correction was:

\[
bw5 = \frac{\text{(Number of PAF addresses in the stratum)}}{\text{(Stratum selected addresses for bio mod)}} \times bw4
\]

5) Application of adult non-response (w5)
For within household non-response, the non-response weight (w5) calculated for all households was also applicable for the biological module.

6) Non-response weight for biological module interview
Not all of the adults that responded to the main section of the interview responded to the biological module. Using the information collected for the respondent in the main interview and household interview the likelihood of responding to the biological module was modelled with logistic regression.
The following variables were considered for inclusion in the model:

- Health Board
- Age/sex
- Number of adults in the household
- Employment status of Household reference person
- Presence of a smoker in the household
- Frequency of eating meals together
- Self-assessed general health
- Gardening/DIY/building work in past 4 weeks
- Any physical activity in past 4 weeks
- Economic activity (working/retired/sick)
- Any housework in past 4 weeks
- Marital status
- Tenure
- Urban/rural classification
- Access to a car
- Located within SIMD15 area
- Long-term illness or disability
- Highest qualification held
- Ever had high blood pressure
- Current smoker
- Currently drink alcohol
- Number of natural teeth
- Any barriers to entry to the property

Through running backwards and forwards selection procedures for the logistic regression the following variables were included in the final model for response to the biological module:

- Health Board
- Age/sex
- Number of adults in the household
- Frequency of eating meals together
- Gardening/DIY/building work in past 4 weeks
- Any housework in past 4 weeks
- Urban/rural classification
- Located within SIMD15 area
- Long-term illness or disability
- Currently drink alcohol
- Economic activity (retired)

The final logistic regression model was then used to estimate the probability of response for all individuals that did respond to the biological module. The biological module non-response weight (bw6) was then calculated as the reciprocal of this probability:

\[ bw6 = \frac{1}{\text{Probability of individual's response to bio module}} \]
7) Final calibration for biological module (bio14_wt)

The household (bw4), biological sample correction (bw5), adult non-response (w5), and biological non-response (bw6) weights were combined (bw4 * bw5 * w5 * bw6) and applied to the survey data.

For the final stage of biological module weighting the weighted totals for the survey data were calibrated to match the NRS 2013 mid-year population estimates for private households for Health Boards, age/sex distribution at Scotland level. However, due to the low sample size for the module a number of the categories had to be collapsed. In terms of Health Boards, all areas except for Grampian, Greater Glasgow and Clyde, Highland, and Lanarkshire were grouped together. For the age groups, the lowest two age groups were combined as were the highest two age groups.

1.7.5 Non-biological module weights (Version A)

A weight titled “Version A” was calculated for the individual respondents in the main sample that were not selected for the biological module. This consisted of the main sample without the Health Board boost sample. The following steps were followed to derive the weight:

1) Address selection weight (bw1)
   As derived in the first step of the biological module weight.

2) Dwelling unit (w2) and household selection weights (w3)
   The dwelling unit and household selection weights from the main adult weight were applied as above.

3) Calibrated household weight (bw4)
   As derived for the biological module.

4) Adult non-response weight (w5)
   For within household non-response, the non-response weight (w5) calculated for all households was also applicable for the biological module.

5) Final calibration for Version A weight (verA14wt)
   The household (bw4) and adult non-response (w5) weights were combined (bw4 * w5) and applied to the survey data. As was the case with the main adult weight and biological module weight, the weighted totals for the survey data were calibrated to match the NRS 2013 mid-year population estimates for private households for Health Boards, age/sex distribution at Scotland level.

1.7.6 Overall child weights

An overall child weight was derived for child responses from the main sample and from the child boost combined. Separate logistic regression non-response weights were not required for the child samples as the
response rate for children within cooperating households was sufficiently high at 97%. The weighting steps are shown below. Steps (1) and (2) followed the same process as described in 3.2 above.

1) Address selection weight for main sample and child boost combined (cw1)

2) Dwelling unit (cw2) and household (cw3) selection weights

3) Selection of children within each household (cw4)

A maximum of two children were eligible for interview in each household. To ensure that children in larger households were not under-represented in the final sample the following child selection weight was calculated for households with more than two children to compensate for the probability of selection:

\[ cw4 = \frac{\text{Number of children in the household}}{2} \]

For households with two or less children cw4=1.

4) Calibration for child interview weight (cint14wt)

The address selection (cw1), dwelling unit (cw2), household (cw3) and child selection weights (cw4) were combined (cw1*cw2*cw3*cw4) and applied to the survey data. The weighted totals for the survey data were calibrated to match the NRS 2013 mid-year population estimates for private households for Health Boards, age/sex distribution at Scotland level.

1.7.7 Combined weights

Several weights have also been calculated to allow for analysis of combined data from the 2012, 2013 and 2014 surveys.
The weights provided for combined years of data are:

<table>
<thead>
<tr>
<th>Weight name</th>
<th>Purpose of combined weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>int121314_wt</td>
<td>For analysis of 2012, 2013 and 2014 combined adult data</td>
</tr>
<tr>
<td>vera1214_wt</td>
<td>For analysis of 2012 and 2014 combined version A adult module data</td>
</tr>
<tr>
<td>cint121314_wt</td>
<td>For analysis of 2012, 2013 and 2014 combined child data</td>
</tr>
<tr>
<td>bio121314_wt</td>
<td>For analysis of 2012, 2013 and 2014 combined biological data</td>
</tr>
</tbody>
</table>

In each case, the calculation of the weights followed the same procedure. The pre-calibration weights which had already been calculated for the individual years (which take into account selection weighting and (except for the child weights) non-response weighting) were combined and calibrated to Health Board and age/sex 2013 population totals for private households.

1.8 DATA ANALYSIS AND REPORTING

SHeS is a cross-sectional survey of the population. It examines associations between health status, personal characteristics and behaviour. However, such associations do not necessarily imply causality. In particular, associations between current health status and current behaviour need careful interpretation, as current health may reflect past, rather than present, behaviour. Similarly, current behaviour may be influenced by advice or treatment for particular health conditions.

1.8.1 Reporting age variables

Defining age for data collection

A considerable part of the data collected in the 2014 SHeS is age specific, with different questions directed to different age groups. During the interview the participant’s date of birth was ascertained. For data collection purposes, a participant’s age was defined as their age on their last birthday before the interview.

Age as an analysis variable

Age is a continuous variable, and an exact age variable on the data file expresses it as such (so that, for example, someone whose 24th birthday was on January 1 2014 and was interviewed on October 1 2014 would be classified as being aged 24.75 (24¾)).
The presentation of tabular data involves classifying the sample into year bands. This can be done in two ways, age at last birthday and ‘rounded age’, that is, rounded to the nearest integer. In this report all references to age are age at last birthday.

**Age standardisation**

Some of the adult data included in the 2014 report have been age-standardised to allow comparisons between groups after adjusting for the effects of any differences in their age distributions. If data reported have been age-standardised this is highlighted in the title to the table or chart. When different sub-groups are compared in respect of a variable on which age has an important influence, any differences in age distributions between these sub-groups are likely to affect the observed differences in the proportions of interest.

It should be noted that all analyses in the report are presented separately for men and women and on some occasions data for all adults are also presented. All age standardisation has been undertaken separately within each sex, expressing male data to the overall male population and female data to the overall female population. When comparing data for the two sexes, it should be remembered that no age standardisation has been introduced to remove the effects of the sexes’ different age distributions.

Age standardisation was carried out using the direct standardisation method. The standard population to which the age distribution of sub-groups was adjusted was the mid-year 2013 household population estimates for Scotland. The age-standardised proportion $p'$ was calculated as follows, where $p_i$ is the age specific proportion in age group $i$ and $N_i$ is the standard population size in age group $i$:

$$p' = \frac{\sum_i N_i p_i}{\sum_i N_i}$$

Therefore $p'$ can be viewed as a weighted mean of $p_i$ using the weights $N_i$. Age standardisation was carried out using the age groups: 16-24, 25-34, 35-44, 45-54, 55-64, 65-74 and 75 and over. The variance of the standardised proportion can be estimated by:

$$\text{var}(p') = \frac{\sum_i (N_i^2 p_i q_i / n_i)}{(\sum_i N_i)^2}$$

where $q_i = 1 - p_i$.

### 1.8.2 Standard analysis breakdowns

**Household income**

The 2014 survey included questions designed to measure participants’ household income. While household income alone can be used as an analysis variable, the analysis conducted for this report used an adjusted measure which took account of the number of persons within the household. The McClements method was used to equilivate incomes; this is detailed in the Glossary at the end of this report. The
equivalised income measure was divided into quintiles for the presentation of analysis within the report, but the full continuous data is available on the dataset.

**Scottish Index of Multiple Deprivation (SIMD)**

The analysis of 2014 data was based on the 2012 version of the Scottish Index of Multiple Deprivation. It is based on 38 indicators in seven individual domains of current income, employment, housing, health, education, skills and training, geographic access to services and crime. SIMD is calculated at data zone level, enabling small pockets of deprivation to be identified. The data zones are ranked from most deprived (1) to least deprived (6505) on the overall SIMD index. The result is a comprehensive picture of relative area deprivation across Scotland. The index was divided into quintiles for the presentation of analysis within this report, a version divided into deciles is also available on the dataset. The full index is not available on the archived dataset due to concerns about its potential for identifying individual respondents or households.

### 1.8.4 Regression

Regression modelling has been used in Chapter 3 to examine the factors associated with successful quit attempts among smokers and ex-smokers. Models were run for men and women separately. A wide range of possible predictor variables were tested in each model. This gives an estimate of the independent effect of each predictor variable on the outcome when all the other independent variables were included in the model. Some variables, including those for the use of NRT products and electronic cigarettes were excluded from the model due to high levels of collinearity with other variables in the model. Other variables, such as level of physical activity and socio-economic classification (NSSEC) were excluded because they showed no independent association with the dependent variable for either men or women.

The results of the binary logistic regression analysis are presented in tables showing odds ratios for the final models, together with the probability that the association is statistically significant. The predictor variable is significantly associated with the outcome variable if $p < 0.05$. The models show the odds of being in the particular category of the outcome variable (i.e. successful quitter) for each category of the independent variable (e.g. BMI). Odds are expressed relative to a reference category, which has a given value of one. Odds ratios greater than one indicate higher odds, and odds ratios less than one indicate lower odds. Also shown are the 95% confidence intervals for the odds ratios. Where the interval does not include one, this category is significantly different from the reference category.

### 1.8.5 Design effects and true standard errors

SHeS 2014 used a clustered, stratified multi-stage sample design. In addition, weights were applied when obtaining survey estimates. One of
the effects of using the complex design and weighting is that standard errors for survey estimates are generally higher than the standard errors that would be derived from an unweighted simple random sample of the same size. The calculations of standard errors shown in tables, and comments on statistical significance throughout the report, have taken the clustering, stratification and weighting into account. The ratio of the standard error of the complex sample to that of a simple random sample of the same size is known as the design factor. Put another way, the design factor (or ‘deft’) is the factor by which the standard error of an estimate from a simple random sample has to be multiplied to give the true standard error of the complex design. The true standard errors and defts for SHeS 2014 have been calculated using a Taylor Series expansion method. The deft values and true standard errors (which are themselves estimates subject to random sampling error) are shown in Tables 1.10 to 1.17 for selected survey estimates presented in the main report.

Tables 1.10 - 1.17
References and notes

1 The 1995 and 1998 surveys were carried out by the Joint Health Surveys Unit of the National Centre for Social Research (NatCen Social Research) and the Department of Epidemiology and Public Health University College London Medical School (UCL). The MRC Social and Public Health Sciences Unit at the University of Glasgow (MRC SPHSU) joined the consortium in 2003. ScotCen Social Research (a branch of NatCen Social Research), UCL and MRC SPHSU conducted the 2008-2011 surveys after a decision was made to carry out the survey annually.

4 Further information on the sample designs and the methodology used is available here: www.gov.scot/Topics/Statistics/About/SurveyDesigns201215

5 Further information on the 2011 Scottish Health Survey questionnaire review for the 2012-2015 surveys can be found on the Scottish Government SHeS website: www.gov.scot/Topics/Statistics/Browse/Health/scottish-health-survey/questionnairereviewreport

6 The household reference person (HRP) is defined as the householder (a person in whose name the property is owned or rented) with the highest income. If there is more than one householder and they have equal income, then the household reference person is the eldest.

8 A report on the development of the weighting procedures is available here: www.gov.scot/Topics/Statistics/About/Surveys/WeightingProjectReport

9 Where time series SIMD data are presented, the appropriate version of the SIMD is used for each year. More details are provided within the main report and at www.gov.scot/Topics/Statistics/SIMD/Publications

a For the method of estimating the child 'set' sample, see Section 1.6.4. Estimated bases have been rounded.
b Only 2 children per household were eligible for interview so if more than 2 children were in the household the additional ones were not interviewed.
c Height and weight measurements were only taken from children aged 2+. As the set sample is based on children aged 0 to 15 the figures shown will underestimated the height and weight response rates.

Chapter 2
Quality control of urine and saliva analytes
CHAPTER 2: QUALITY CONTROL OF URINE AND SALIVA ANALYTES

Shanna Christie, Julie Day, Mira Doig, Alix Hampson, and Lisa Rutherford

2.1 INTRODUCTION AND KEY CONCLUSIONS

This section describes the assay of analytes for the 2014 Scottish Health Survey (SHeS) biological samples and the quality control and quality assessment procedures that were carried out during the survey period. Details of procedures used in the collection, processing and transportation of the specimens are described in Appendix B.

The overall conclusion for the data provided in this chapter is that methods and equipment used for the measurement of urine and saliva analytes produced internal quality control (IQC) and external quality assessment (EQA) results within expected limits. The results of the analyses for each of the main urine analytes and saliva cotinine levels were acceptable for the 2014 SHeS.

2.2 ANALYSING LABORATORIES

As in previous years, the Royal Victoria Infirmary (RVI) in Newcastle upon Tyne was the analysing laboratory for the urine sample analyses in 2014. Salivary cotinine analysis of the 2014 samples was conducted by ABS Laboratories in Welwyn Garden City, Hertfordshire.

2.3 SAMPLES COLLECTED

2.3.1 Urine samples

A mid-flow spot urine sample was obtained from participants aged 16 and over taking part in the biological module. Urine samples were collected for analysis of sodium, potassium and creatinine. Participants were instructed to provide a sample of urine in the disposable collection beaker and then use the special urine collection syringe to draw up the sample. An instruction card was given to participants demonstrating how to use the syringe. Interviewers could also draw up the sample from the beaker if the participant preferred this. The urine collection syringe was then labelled and packaged ready for dispatch.

2.3.2 Saliva samples

A saliva sample was obtained from participants aged 16 and over. Saliva samples were collected for analysis of cotinine (a metabolite of nicotine that shows recent exposure to tobacco smoke). A saliva collection tube was used for this purpose. Participants were also offered the option to provide the saliva sample using a dental roll that they could saturate with their saliva before it was placed in the tube. The saliva tube was then labelled and packaged ready for dispatch.
2.4 METHODOLOGY

2.4.1 Laboratory procedures for urine sample analyses

All analyses were carried out according to Standard Operating Procedures by State Registered Biomedical Scientists (BMS) under the supervision of the Senior BMS. All results were routinely checked by the duty Biochemist.

A schedule of Planned Preventative Maintenance was used for each item of analytical equipment. These plans were carried out jointly by the manufacturers and the laboratories. Records were kept of when maintenance was due and carried out.

2.4.2 Laboratory procedures for saliva sample analyses

All analyses were carried out according to Standard Operating Procedures by analysts in a MHRA Good Laboratory and Good Clinical Practice (GLP & GCP) accredited laboratory. All work is reviewed by the Laboratory & QA Manager.

A schedule of Planned Preventative Maintenance was used for each item of analytical equipment. These plans were carried out jointly by the manufacturers and the laboratories’ staff. Records were kept of when maintenance was due and carried out.

2.4.3 Urine sample analytical methods and equipment

Urinary sodium, potassium and creatinine analysis was carried out in the Blood Sciences (formerly Biochemistry) Department at the RVI using a Roche Modular P analyser. Urinary sodium and potassium were analysed using the indirect ISE method. Urinary creatinine was analysed using the Jaffe method. A Roche Modular P analyser was used throughout the SHesS 2014. The Roche Modular P analyser has been used in SHesS since April 2010, prior to this an Olympus 640 analyser was used.

2.4.4 Saliva sample analytical methods and equipment

Saliva samples received at the RVI were checked for correct identification, assigned a laboratory accession number, and stored at 4°C. Samples were checked for details and despatched fortnightly in polythene bags (20 samples per bag) by courier for overnight delivery to ABS Laboratories, where cotinine analysis was carried out. This laboratory specialises in accurate measurement of low levels of cotinine and therefore takes special precautions to ensure no contamination by environmental tobacco smoke occurs.

The method of analysis used was high performance liquid chromatography coupled to tandem mass spectrometry with multiple reaction monitoring (LC-MS/MS). The sample preparation prior to LC-MS/MS was liquid/liquid extraction. A Tomtec Quadra was used to allow
for the automation of some of the sample preparation. All methods were validated before use.

An advantage of the LC-MS/MS assay is that it is less prone than other methods to non-specific interference when assaying low levels of cotinine as seen due to passive smoking, and so is preferable for samples from non-smokers\(^1\).

A disadvantage of LC-MS/MS is that it does not have the dynamic range of the GC-NPD assay used in previous years.\(^1\) Therefore in SHeS 2014 the laboratory was informed whether the samples were from self-reported smokers or not. All the samples from self-reported smokers were first assayed using the high calibration range assay of 1 to 750 ng/mL, and any that were below 1 ng/mL were then re-assayed with the low range assay. All the remaining samples were first assayed using the low range assay that quantified samples over the range 0.1 to 50 ng/mL. Any of these that were over-range were then re-assayed using the high calibration range assay of 1 to 750 ng/mL, provided there was sufficient saliva available from that participant.

2.5 INTERNAL QUALITY CONTROL (IQC)

2.5.1 Explanation of IQC

The purpose of internal quality control (IQC) is to ensure reliability of an analytical run. IQC also helps to identify, and prevent the release of, any errors in an analytical run. IQC is also used to monitor trends over time.

For each analyte or group of analytes, the laboratory obtains a supply of quality control materials, usually at more than one concentration of analyte. Target (mean) values and target standard deviations (SD) are assigned for each analyte. Target assignment includes evaluation of values obtained by the laboratory from replicate measurements (over several runs) in conjunction with target values provided by manufacturers of IQC materials, if available. The standard deviation and the coefficient of variation (CV) are measures of imprecision and are presented in the tables. IQC values are assessed against an acceptable range and samples are re-analysed if any of the Westgard rules have been violated.\(^2,3,4\) Internal quality assessment results are available from ScotCen Social Research upon request.

2.5.2 Urine samples

Two levels of IQC were used for urinary sodium, potassium and creatinine. Quality control samples were run at the beginning of the day and at regular intervals throughout the day.

2.5.3 Saliva samples

ABS laboratories ran 16 non-zero calibration standards for each batch of the low range assay (0.1-50 ng/mL) or high range assays (1-750 ng/mL).
ng/mL). Six quality control (QC) samples, two each at a set concentration to represent Low, Medium and High levels for the calibration range being used, were also analysed with each analytical batch. For the results from any analytical batch to be acceptable, four out of the six QCs must have a bias of no greater than ±15% with at least one from each QC level being within these acceptance criteria, and 75% of the calibration standards must have a bias of no greater than ±15% except at the lower limit of quantification where the bias must be no greater than ±20%.

2.6 EXTERNAL QUALITY ASSESSMENT (EQA)

2.6.1 Introduction

External quality assessment (EQA) permits comparison of results between laboratories measuring the same analyte. An EQA scheme for an analyte or group of analytes distributes aliquots of the same samples to participating laboratories, which are blind to the concentration of the analytes. The usual practice is to participate in a scheme for a full year during which samples are distributed at regular frequency (monthly or bimonthly for example); the number of samples in each distribution and the frequency differ between schemes. The samples contain varying concentrations of analytes. The same samples may or may not be distributed more than once.

Samples are assayed shortly after they arrive at the laboratory. Depending on the frequency of distribution, there may be weeks or months in which no EQA samples are analysed. Results are returned to the scheme organisers, who issue a laboratory specific report giving at least the following data:

- Mean values, usually for all methods and for method groups;
- A measure of the between-laboratory precision;
- The bias of the results obtained by that laboratory.

EQA is a retrospective process of assessment of performance, particularly of inaccuracy or bias with respect to mean values; unlike IQC, it does not provide control of release of results at the time of analysis.

The Welsh External Quality Assessment Schemes (WEQAS) are schemes in which the laboratories participate on a routine basis.

Monthly EQA results are available upon request from ScotCen Social Research.

2.6.2 Urine samples

The Blood Sciences (formerly Clinical Biochemistry) laboratory participates in the WEQAS scheme for the urine analytes (sodium, potassium and creatinine).
2.6.3 **Saliva samples**

There was no external quality control scheme available in 2014 for cotinine analysis but ABS Laboratories participates in inter-laboratory split analyses to ensure comparable results. The latest International inter-laboratory study was published in 2009.
References and notes

2 Westgard rules are a statistical approach to evaluation of day-to-day analytical performance. The Westgard multirule quality control procedure uses five different control rules to judge the acceptability of an analytical run (rather than the single criterion or single set of control limits used by single-rule quality control systems, such as a Levey-Jennings chart with control limits set as either the mean plus or minus 2 standard deviations or the mean plus or minus 3 standard deviations). Westgard rules are generally used with two or four control measurements per run. This means they are appropriate when two different control materials are measured once or twice per material, which is the case in many chemistry applications. Some alternative control rules are more suitable when three control materials are analyzed, which is common for applications in haematology. More detail is available at <www.westgard.com/mltrule.htm#westgard>

The Scottish Health Survey
A brief introduction

We need your help with the Scottish Health Survey.
An interviewer from ScotCen will call at your address and will be able to explain more about the study. In the meantime, you can find out more at: www.scottishhealthsurvey.org

Who is carrying out the study and why?
The Scottish Government has asked ScotCen Social Research to carry out the survey. The Scottish Government will use this information to help plan services and to identify inequalities in health.
The survey is used by other organisations, including:

- NHS Health Scotland have used the survey data to inform their work on monitoring and evaluating the measures taken to tackle problem drinking in Scotland.
- The British Heart Foundation have used the findings to help raise awareness of heart disease risk in Scotland.

How will you change the picture this year?
The information we collect provides an important picture of the health of the nation and helps the Scottish Government and others to plan more effective health services for the future. We rely on the goodwill of people like you to make the study a success. Please take part and help us to make a difference to the health of people in Scotland. Thank you.

We interview around 6,000 people each year as part of the Scottish Health Survey. It's an annual study that looks into the changing health and lifestyles of people living in Scotland.

In recent years we found out that...

**The average man** is 5 foot 9 inches and weighs 13 stone and 5 pounds.

**The average woman** is 5 foot 4 inches and weighs 11 stone and 4 pounds.

**Around 3 in 5 adults** meet the recommended weekly level of moderate or vigorous physical activity.

**7 in 10 children** are active at the recommended level.

**In an average week one fifth of adults** drink twice the recommended daily limit of alcohol on at least one day.

**25% of adults currently smoke.**

**1 in 6 men and women** have some form of cardiovascular disease.

**3/4 of men and women** say their health is 'good' or 'very good'.

**1/5** adults aged 16-24 currently smoke.

**Around 3 in 5 adults** drink twice the recommended daily intake of fruit and veg.

**Adults aged 16-24** are least likely to eat the recommended daily intake of fruit and veg.

**Children** eat 2.7 portions of fruit and veg a day on average.

Just under **2 in 3 adults** are overweight.

Key aspects of the survey include height and weight measurements, plus questions on topics such as physical activity, fruit and vegetable intake, and general health.

In recent years we found out that...

- Adults aged 16-24 are least likely to eat the recommended daily intake of fruit and veg.
- Around 3 in 5 adults meet the recommended weekly level of moderate or vigorous physical activity.
- 7 in 10 children are active at the recommended level.
- 1 in 6 men and women have some form of cardiovascular disease.
- 3/4 of men and women say their health is 'good' or 'very good'.
- In an average week one fifth of adults drink twice the recommended daily limit of alcohol on at least one day.
- 25% of adults currently smoke.

**Just under 2 in 3 adults are overweight.**

**Children** eat 2.7 portions of fruit and veg a day on average.

**The average man** is 5 foot 9 inches and weighs 13 stone and 5 pounds.

**The average woman** is 5 foot 4 inches and weighs 11 stone and 4 pounds.
Dear Sir or Madam,

Your household has been chosen to take part in the Scottish Health Survey.

What is the Scottish Health Survey?
It’s an important annual study that looks at changes in the health and lifestyles of people all over Scotland. People just like you.

Have your say
This is a unique opportunity to have your say. By contributing to this important study, your answers could help identify priorities for health provision and plan services more effectively for the future. Last year around 6,000 people took part. Many found it to be rewarding and interesting. We hope you’ll feel the same.

Interviewer visits
An interviewer from ScotCen Social Research will call at your address and will be able to explain more about the study. The interviewer will show you an identity card with their photograph and interviewer number.

Complete confidentiality
Your answers will be kept completely confidential (in accordance with the Data Protection Act 1998) and will be used for statistical and research purposes only.

Thank you
We rely on the goodwill and voluntary co-operation of the people who are selected to take part to make the study a success. We need to speak to as many people as possible and from all walks of life to get an accurate picture of health across Scotland. As a little thank you in advance, please take this letter to your local post office to receive £10.

Further info
We have answered some of the questions you may have on the back of this letter. For more details, please see the enclosed leaflet or visit www.scottishhealthsurvey.org. If you would like to talk to someone about the study, please phone us free on 0800 652 4569.

Emma Fenn
Project Coordinator,
ScotCen Social Research

Collect your £10 today!
You can redeem this voucher at any Post Office branch. Counter staff will make your payment in cash. See back for more information.

Emma Fenn
Project Coordinator,
ScotCen Social Research

ScotCen Social Research, 73 Lothian Road, Edinburgh, EH3 9AW Tel. 0800 652 4569
A Company Limited by Guarantee, Charity No. SC038454
How did you choose my address?

We chose your address at random from the Postcode Address File. This file is held by the Post Office and is available to the public.

What will happen to any information I give?

We will treat information you give in strict confidence under the Data Protection Act 1998. The results collected are used for statistical and research purposes only and will help inform the planning of future health services. No information that allows you to be identified will be made public.

Who is carrying out the survey?

The Scottish Government has asked ScotCen Social Research, in collaboration with the Medical Research Council Social and Public Health Sciences Unit (MRC SPHSU) at the University of Glasgow, and academics from the Universities of Aberdeen and Edinburgh, to carry out the survey. ScotCen, the MRC SPHSU and the Universities of Aberdeen and Edinburgh are independent of all government departments and political parties. For more information about Scotcen Social Research visit www.scotcen.org.uk.

What is the interview about?

The interview covers a range of health topics, including general health and lifestyles. If you agree, the interviewer will also take some measurements, such as height and weight.

Where can I find out more?

See the enclosed leaflet, visit www.scottishhealthsurvey.org or phone us free on 0800 652 4569.

The survey has been reviewed by an independent Research Ethics Committee to protect your safety, rights, wellbeing and dignity.

Take this voucher to any Post Office. Counter staff will make your payment in cash. You do not need to show any form of identity. Your voucher is valid until the expiry date shown.

**The 2014 Scottish Health Survey**

This survey is being carried out for the Scottish Government by ScotCen Social Research, an independent research institute, the MRC Social and Public Health Sciences Unit at the University of Glasgow and academics from the Universities of Aberdeen and Edinburgh. This leaflet tells you more about the survey and why it is being done.

**What is it about?**

The first Scottish Health Survey was commissioned in 1995 by the Scottish Office because it was concerned about the lack of information about the health of people in Scotland. The survey was repeated again in 1998 and 2003 and has been conducted annually since 2008. The detailed information provided by these surveys has proved very valuable and is used to help develop ways of improving people’s health and to plan the services people need at times of ill health. The 2014 survey will update the information collected in previous surveys.

The 2014 survey has questions about your general health, and about behaviour that can affect your health such as eating habits, physical activity, smoking and drinking. There are also some questions about diseases of the heart, lungs and chest. The Scottish Government are particularly interested in having this information because at present the rates of heart disease in Scotland are among the highest in the world.

The survey also collects, if you agree, height and weight measurements. Some personal details such as age, sex and employment are also included to help interpret this information.
Why have we come to your household?

To visit every household in Scotland would take too long and cost too much money. Instead we select a sample of addresses in such a way that all addresses in the country have a chance of being chosen. Yours is one of those chosen for the 2014 survey.

Who will we want to speak to?

We would like to interview every adult (aged 16 and over) who lives in your household, and if there are any children aged 0-15 we would like to interview two of them. Parents or guardians will answer questions on behalf of children aged under 13.

Is the survey confidential?

Yes. We take very great care to protect the confidentiality of the information we are given. The information collected is used for statistical and research purposes only and will be dealt with according to the principles of the 1998 Data Protection Act. The Scottish Government and ScotCen guarantee that the survey results will not be published in a form that can reveal your identity and that no attempts will be made to identify individuals from their answers. Your name and address will only be known to the ScotCen research team unless you give your consent for it to be passed to the Scottish Government, for example so they could invite you to take part in a further study about health.

If you agree and give us your written consent, your NHS health records, including information about in-patient or out-patient visits or diagnosis, will be linked with your survey answers. This increases the value of the information you provide. This is done confidentially and no data which can identify you or any other individual is released.

If you were to decide at a later date that you no longer wanted the information collected about you to be used in the survey then it would be deleted.

Is the survey compulsory?

No. In all our surveys we rely on voluntary co-operation. The success of the survey depends on the goodwill and co-operation of those asked to take part. The more people who do take part, the more useful the results will be. You are free to withdraw from any part of the survey at any time, and you do not have to answer all the questions.

Do I get anything from the survey?

If you wish, you may have a record of your measurements. Other benefits from the survey will be indirect and in due course will come from any improvements in health and in health services which result from the survey.

What if I have any other questions?

We hope this leaflet answers the questions you may have, and that it shows the importance of the survey. If you have any other questions about the survey, please do not hesitate to ring one of the contacts listed below.

Your co-operation is very much appreciated.

Thank you very much for your help with this survey.

Is the survey compulsory?
No. In all our surveys we rely on voluntary co-operation. The success of the survey depends on the goodwill and co-operation of those asked to take part. The more people who do take part, the more useful the results will be. You are free to withdraw from any part of the survey at any time, and you do not have to answer all the questions.

Do I get anything from the survey?
If you wish, you may have a record of your measurements. Other benefits from the survey will be indirect and in due course will come from any improvements in health and in health services which result from the survey.

What measurements are included in the survey?
Adults aged 16 and over will be asked to have their height, weight, waist circumference and blood pressure measured, and to provide urine and saliva samples. The interviewer has been given specialist training to conduct these measurements and to handle the samples. Taking part in the measurements and providing samples is voluntary – you can answer the questions in the rest of the survey and choose to miss out the measurements and samples if you prefer. The interviewer will give you a leaflet that explains more about the measurements and samples.

Any children aged 2-15 in your household that take part in the survey will be asked to have their height and weight measured. Children will not be asked to take part in any other measurements or to provide samples.

Who has reviewed the study?
The study has been looked at by an independent group of people called a Research Ethics Committee, to protect your safety, rights, wellbeing and dignity. This study has been given a favourable opinion by the Research Ethics Committee for Wales on behalf of the NHS.
Your measurements:

If you want us to we will measure how tall you are and what you weigh. You can use the space below to keep a copy of this if you wish. If you do not want this written down please just say.

Scottish Health Survey 2014

Information for Children

The Scottish Health Survey is a survey to find out about the health of people in Scotland.

Every year around 1,700 children and 4,000 adults take part in the study.

This leaflet tells you more about the study and why it is being done.
What are the questions about?
The interviewer will ask you some questions about your general health and illness. The interviewer will also ask about things that can affect your health like the kinds of food you eat and what kinds of sports and activities you do.

What are the measurements?
If you agree, the interviewer will also measure your height and weight. If you want, the interviewer will write down your height and weight for you.

Who will see my answers?
The interviewer will not tell anyone you know about the answers you give. Only the research team at ScotCen will see the information about you.

Why have you come to my house?
To visit every household in Scotland would take too long and cost too much money. Instead we select a small number of addresses and ask the people at each address to take part in the Scottish Health Survey.

Do I have to answer the questions?
No, not if you don’t want to. If you only want to answer some of the questions this is okay too. If you are aged 12 or under your mum, dad or the person who looks after you will answer the questions with your help. If you don’t want them to answer a question about you this is okay, just tell them not to.

Do I have to be measured and weighed?
No, not if you don’t want to. The interviewer will ask you if it’s okay to measure your height and weight before he or she takes your measurements.

If I have any other questions?
We hope this leaflet answers the questions you may have. If you have any other questions about the study, please ask the interviewer. You can also send an email with any questions to:

scottishhealthsurvey@scotcen.org.uk

Thank you for your help with this study.
What if I have any questions?

We hope this leaflet answers the questions you may have, and that it shows the importance of the survey. A separate information sheet for children is also available.

If you have any other questions about the survey, please do not hesitate to ring one of the contacts listed below.

Your co-operation is very much appreciated.

Thank you very much for your help with this survey.

The 2014 Scottish Health Survey

Information for Parents

This survey is being carried out for the Scottish Government by ScotCen Social Research, an independent research institute, the MRC Social and Public Health Sciences Unit at the University of Glasgow and academics from the Universities of Aberdeen and Edinburgh.

This leaflet tells you more about the survey and why it is being done.

What is it about?

The first Scottish Health Survey was commissioned in 1995 by the Scottish Office because it was concerned about the lack of information about the health of people in Scotland. The survey was repeated again in 1998 and 2003 and has been conducted annually since 2008. The detailed information provided by these surveys has proved very valuable and is used to help develop ways of improving people’s health and to plan the services people need at times of ill health. The 2014 survey will update the information collected in previous surveys.

The 2014 survey will collect information about a range of health conditions and about behaviour that can affect health such as eating habits and physical activity. The Scottish Government and NHS Health Scotland would like better information about the health of children and so each year extra children are interviewed.

For further information and advice on healthy living please see the Healthier Scotland website:

www.takelifeon.co.uk

Information about common health conditions is available here:

www.nhsinform.co.uk
What is involved?
For children, the survey has questions about general health and about behaviour that can affect health such as eating habits and physical activity. Parents or guardians will be asked to answer on behalf of children up to the age of 12 – with help from the child when possible. Children aged 13-15 will be interviewed in person – with their parent or guardian present in the home.

The interviewer will also ask permission to collect some physical measurements like height and weight.

Parents are asked some personal details such as age, sex and employment which are needed to interpret the information about children’s health.

Why have we come to your household?
To visit every household in Scotland would take too long and cost too much money. Instead we select a sample of addresses and ask the people at each address to take part in the Scottish Health Survey. For this part of the survey we would like to invite up to two children aged 0-15 to take part.

Is the survey confidential?
Yes. We take very great care to protect the confidentiality of the information we are given. The information collected is used for statistical and research purposes only and will be dealt with according to the principles of the 1998 Data Protection Act. The Scottish Government and ScotCen guarantee that the survey results will not be published in a form that can reveal anyone’s identity and that no attempts will be made to identify individuals from their answers. Your child’s name and address will only be known to the ScotCen research team unless you give your written consent for it to be passed to The Scottish Government, for example so they could invite you to take part in a further study about health.

If you agree and give us your written consent, the information provided in this survey about your child’s NHS health records, including information about in-patient or out-patient visits or diagnosis, will be linked to your survey answers. This increases the value of the information provided. This is done confidentially and no data which can identify your child or any other individual is released.

If you were to decide at a later date that you no longer wanted the information collected about your child to be used in the survey then it would be deleted.

Is the survey compulsory?
No. In all our surveys we rely on voluntary co-operation. The success of the survey depends on the goodwill and co-operation of those asked to take part. The more people who do take part, the more useful the results will be. You and your child are free to withdraw from any part of the survey at any time, and you do not have to answer all the questions.

Do I get anything from the survey?
If you wish, your child may have a record of their height and weight measurements. Other benefits from the survey will be indirect and in due course will come from any improvements in health and in health services which result from the survey.

Useful Contacts

Local contacts:
A GP (General Practitioner): Your GP will be able to provide help and advice and can provide access to appropriate specialist services and local organisations.

There are also many local organisations providing a range of services including support groups, helplines and information. Details can be obtained from your GP, your local library, or they may be listed in the telephone directory.

The national organisations listed below may also be able to put you in touch with local groups:

NHS 24
Provides help and advice from a qualified nurse on a wide range of health problems and issues.
08454 24 24 24
www.nhs24.com

www.nhsinform.co.uk (0800 22 44 88) also provides information about health and conditions in Scotland.

For more information about healthy eating or physical exercise please see the Healthier Scotland website: www.takelifeon.co.uk

For more information about stopping smoking please see the NHS Smokefree website: smokefree.nhs.uk (0800 022 4332).
Alzheimer Scotland
Provides support for people with dementia and for the people who care for them.
0808 808 3000 - free 24 hour helpline
www.alzscot.org

Alcoholics Anonymous
A fellowship of men and women who share their experience, strength and hope with each other that they may solve their common problem and help others recover from alcoholism.
0845 769 7555
www.alcoholics-anonymous.org.uk

Narcotics Anonymous
A fellowship of men and women for whom drugs have become a major problem. The only requirement for membership is the desire to stop using drugs.
0300 999 1212
www.ukna.org

Victim Support line
Provides help and information to anyone who has been affected by a crime, including domestic violence and sexual assault.
Scottish helpline 0845 603 9213 (8am-8pm Mon-Fri)
UK supportline 0845 30 30 900 (9am-9pm weekdays, 9am-7pm weekends)
www.victimsupport.org.uk

Scottish Domestic Abuse Helpline
Information service for those affected by domestic and/or sexual abuse.
www.scottishdomesticabusehelpline.org.uk
0800 027 1234 (24 hours)

Domestic Abuse Helplines
Provide access to 24-hour emergency refuge accommodation as well as an information service.
www.refuge.org.uk
0808 2000 247 (free 24 hrs)

LGBT Helpline Scotland
Helpline provides information and emotional support to lesbian, gay, bisexual and transgender people - or their friends or family.
0300 123 2523 – Tuesday and Wednesday 12 – 9pm
www.lgbthealth.org.uk

The Samaritans
The Samaritans provide a confidential service for people in despair and who feel suicidal.
08457 90 90 90 - 24 hour phone line:
www.samaritans.org

Breathing Space Scotland
Breathing Space is a confidential phoneline service for any individual, who is experiencing low mood or depression, or who is unusually worried and in need of someone to talk to.
0800 83 85 87 – (free) 6pm-2am Mon-Thurs;
6pm Friday – 6am Monday
www.breathingspacescotland.co.uk

SAMH (Scottish Association for Mental Health)
Offers confidential help on a range of mental health issues.
0800 917 3466 - Mon-Fri 2pm – 4pm
www.samh.org.uk

SANE
Provides information and support to people who suffer from all forms of mental illness and their friends and families.
0845 767 8000 - 6pm-11pm every day
www.sane.org.uk

Supportline
Confidential telephone helpline offering emotional support to any individual on any issue including child abuse, bullying, eating disorders, domestic violence, rape, mental health, depression, anxiety and addictions.
01708 765 200
www.supportline.org.uk
The Measurements

Height and Weight

Lately there has been much discussion about the relationship between weight and health and we are looking at weight in relation to height.

<table>
<thead>
<tr>
<th>Height:</th>
<th>cm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ft/ins</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Weight:</th>
<th>kg</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>st/lbs</td>
</tr>
</tbody>
</table>

For adults, height and weight information can be used to calculate Body Mass Index (BMI). Further information on this calculation and guidance on BMI can be found on this website: www.nhs.uk/Tools/Pages/Healthyweightcalculator.aspx

Waist measurement

Your waist measurement is useful for assessing distribution of weight over the body. The interviewer will ask you to pass the tape measure around your waist, over your clothes.

<table>
<thead>
<tr>
<th>Waist measurement:</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Measurement:</td>
</tr>
<tr>
<td>Second Measurement:</td>
</tr>
</tbody>
</table>

Blood Pressure

Blood pressure is measured using an inflatable cuff that goes around your upper arm. High blood pressure can be a health problem. A person’s blood pressure is influenced by age and can vary from day to day with emotion, meals, tobacco, alcohol, medication, temperature and pain. The interviewer will tell you your blood pressure along with an indication of its meaning. However, a diagnosis cannot be made on measurements taken on a single occasion.

<table>
<thead>
<tr>
<th>Systolic (mmHg)</th>
<th>Diastolic (mmHg)</th>
<th>Pulse (bpm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average</td>

</tbody>
</table>

Blood pressure interpretation:

Summary of advice given by interviewer:

- ☐ Normal
- ☐ Raised
- ☐ Mildly raised
- ☐ Considerably raised

Visit your GP to have your blood pressure checked within:

____________________________
Saliva Sample
We would like to take a sample of saliva (spit). This simply involves dribbling saliva into a tube, or sucking on a piece of cotton wool. The interviewer will ask you to sign a consent form before any sample is taken. The sample will be analysed for cotinine. Cotinine is related to the intake of cigarette smoke and is of particular interest to see whether non-smokers may have raised levels as a result of ‘passive’ smoking. The saliva will only be tested for cotinine. It will not be tested for other substances, like drugs or alcohol.

Urine Sample
We would like you to provide a sample of your urine. The interviewer will ask you to sign a consent form before any sample is taken. Analysis of urine samples tells us how much sodium (salt) there is in people's diets. This is useful information for assessing the health of the population, as high salt levels are related to health-related conditions such as high blood pressure. This sample will only be used to measure salt levels and will not be tested for drug or alcohol use.

What will happen to the saliva and urine samples I give?
Your saliva and urine samples will be sent to a laboratory, and analysed as outlined in the previous section. Your name and address will not be attached to the samples and so your samples will remain confidential. The anonymous saliva and urine samples will be destroyed after the analysis is carried out. No genetic (DNA) tests will be conducted, only the analysis outlined above.

As your results will be presented anonymously and cannot be linked to you, it would not be possible to remove your results from any published reports.
Scottish Health Survey 2014

Questionnaire documentation

Section contains:
Notes on how to use this documentation
Survey outline
Household interview
Individual interview
Notes

1. This is an edited documentation of the computer programmes used in the SHeS household and individual interviews. Instead of being numbered each question has a variable name; these are identified here in square brackets, e.g.: [varname].

2. Not all variables that appear here will be on the final data file (those that are not are marked with a ‘*’). Similarly, not all derived variables that will be on the data file are mentioned here. There will be a separate documentation of derived variables when the data is released.

3. Routing instructions appear above the questions. A routing instruction should be considered to stay in force until the next routing instruction.

4. Sections of text in brackets and italics were filled in as appropriate on the interviewers’ computers.

5. Individual codes marked ‘EDIT ONLY’ were used by the editors to reclassify ‘other’ answers and are not visible during the main interviews.

6. For some questions respondents could give a different answer to the main options they were presented with. Such answers are recorded verbatim and were examined during the editing process to see whether they could be ‘back-coded’ to one of the existing answer categories. These will not be available on the data file and have been indicated within this documentation with a ‘*’.

7. Some questions allowed respondents to give more than one answer (indicated within this documentation with the instruction: ‘CODE ALL THAT APPLY’). In these cases each individual answer option will have its own variable name which is shown in square brackets to the right of the answer.

8. The symbol ‘$’ has been used to flag CAPI questions which have been used in conjunction with Self-Complete questions to combine the answers into a separate derived variable.

Important note for data users: You are advised to use the documentation accompanying the final dataset released by the UK Data Archive as there may be updates or corrections to the documentation between the publication of the annual report and the release of the final dataset.
Scottish Health Survey 2014 – Survey outline

- A **household** interview with the household reference person (HRP) or their spouse or partner
- An **individual** interview with eligible participants. Eligibility criteria for each of the **three** sample types were as follows:
  - **Main sample** - up to ten adults and two children per household
  - **Child boost sample** - up to two children (0-15) per household
  - **Health Board boost sample** - up to ten adults per household

**Questionnaire content**

*Household questionnaire*
There was only one version of the household questionnaire across all three sample types in 2014. The household questionnaire documentation begins on page 7 of this documentation.

*Individual questionnaire*
The questionnaire content varied depending firstly on the sample type, and then the age of the participants being interviewed. The questionnaire documentation details exactly who was eligible to answer particular modules and questions within these modules.

- **Main sample** - there were two versions of the individual interview questionnaire for the main sample: version A and version B. The content and order of the individual interview differed depending on which version a household was selected to go through. Some topics were asked in both versions of the questionnaire, e.g. ‘general health including caring’ and ‘eating habits for children’ while other topics are only asked in one of the versions, e.g. ‘additional asthma questions and eating habits for adults’ in version A. The below on the following page outlines which topics are asked in which version of the questionnaire.

- **Child Boost sample** – The individual questionnaire at child boost households followed the same format as a main version A individual questionnaire (see table on following page).

- **Health Board Boost sample** – Adults in the Health Board boost sample were only asked questions on those topics that appeared in both version A and version B of the individual interview, for example, *general health*, and *physical activity.*
Points to note:
- There are four versions of the questionnaire in the mainstage: Core Version A; Core Version B (biological module); Child Boost; and Health Board Boost.
- Children are not eligible for the biological module in Core Version B or at Health Board Boost sampled addresses.
- The below table indicates what should be in each version and the order of the interview. The associated CAPI block names are in [] after the topic.

Date:

INTERVIEWER: COLLECT THE NAMES OF THE PEOPLE IN THIS HOUSEHOLD.
1  Continue

IF First person in household OR More=Yes THEN

What is the name of (person number)?

Is there anyone else in this household?
1  Yes
2  No

(Name and More repeated for up to 12 household members)
So, can I check, altogether there are \((x)\) people in your household?

1. Yes
2. No, more than \((x)\)
3. No, less than \((x)\)

**HOUSEHOLD COMPOSITION GRID FOR ALL HOUSEHOLD MEMBERS (MAXIMUM 12)**

**[Person]**
*Person number in Household Grid.*
*Range: 0..12*

**[Name]**
*First name from WhoHere*

**[Sex]**
*ASK: Is \((name \ of \ respondent)\) male or female?*
1. Male
2. Female

**[DoB]**
*What is \((name \ of \ respondent's)\) date of birth?*

Enter Day of month in numbers, Name of month in numbers, Year in numbers, eg. 02/01/1972.

**[Age]**
*Can I check, what was \((name \ of \ respondent's)\) age last birthday?*
*Range: 0..120*

**IF AgeOf=Dk/Ref THEN**

**[AgeEst]**
*INTERVIEWER CODE: ASK IF NECESSARY ARE YOU (IS HE/SHE), AGED UNDER 2 YEARS, AT LEAST 2 UP TO 15 YEARS, OR 16 YEARS OR OLDER? IF NOT KNOWN, TRY TO GET BEST ESTIMATE.*

1. Under 2 years
2. 2 to 15 years
3. 16-64 years
4. 65 years or older
IF Age of Respondent is 16 or over THEN

[Marital12]
SHOW CARD A1
Please look at this card and tell me your legal marital or same-sex civil partnership status
INTERVIEWER: CODE FIRST THAT APPLIES.

1   Single, that is never married or never formed a legally recognised civil partnership
2   Married and living with (husband/wife)
3   A civil partner in a legally recognised civil partnership
4   Married and separated from (husband/wife)
5   In a legally recognised civil partnership and separated from your civil partner
6   Divorced
7   Formerly a civil partner, the civil partnership now legally dissolved
8   Widowed
9   A surviving civil partner, your partner having since died

IF more than one person aged 16+ in household AND marital status=code 1, 4, 5, 6, 7, 8 or 9
THEN

[Couple]
May I just check, (are you/is he) living with someone in this household as a couple?

1   Yes
2   No
3   SPONTANEOUS ONLY - same sex couple

IF (Age of Respondent is 16-17) THEN

[LegPar]
Can I check, do either of (name of respondent's) parents, or someone who has legal parental responsibility for him/her, live in this household?

1   Yes
2   No

[Par1]
Which of the people in this household are (name of respondent's) parents or have legal parental responsibility for (him/her) on a permanent basis?
INTERVIEWER: CODE FIRST PERSON AT THIS QUESTION. IF Not a household member/dead, CODE 97
Range: 1..12, 97

IF Par1 IN [1..12] THEN

[Par2]
Which other person in this household is (name of respondent's) parent or have legal parental responsibility for him/her on a permanent basis?
CODE SECOND PERSON AT THIS QUESTION. IF No-one else in the household, CODE 97
Range: 1..14, 97

[SelCh]
INTERVIEWER: Is this child selected for an individual interview?

1   Yes
2   No

* = not on the datafile
RELATIONSHIP BETWEEN HOUSEHOLD MEMBERS COLLECTED FOR ALL

IF Person > 1 THEN

[R]
SHOW CARD A2
How is \(\text{name of respondent's}\) related to \(\text{name}\)? Just tell me the number on this card.
1 husband/wife
2 legally recognised civil partner
3 partner/cohabitee
4 natural son/daughter
5 adopted son/daughter
6 foster child
7 stepson/daughter/child of partner
8 son/daughter-in-law
9 natural parent
10 adoptive parent
11 foster parent
12 stepparent/parent's partner
13 parent-in-law
14 natural brother/sister
15 half-brother/sister
16 step-brother/sister
17 adopted brother/sister
18 foster brother/sister
19 brother/sister-in-law
20 grandchild
21 grandparent
22 other relative
23 other non-relative

END OF HOUSEHOLD COMPOSITION GRID

ASK ALL

[HHldr]
In whose name is the accommodation owned or rented? Anyone else?
CODE ALL THAT APPLY.
(Codeframe of all household members)
1-12 Person numbers of household members
97 Not a household member

[HHResp]
INTERVIEWER CODE: WHO WAS THE PERSON RESPONSIBLE FOR ANSWERING THE GRIDS IN THIS QUESTIONNAIRE?
(Codeframe of adult household members)
1-12 Person numbers of household members
97 Not a household member

* = not on the datafile
IF More than one person coded at HHldr THEN

[HiHNum]
You have told me that (name) and (name) jointly own or rent the accommodation. Which of you /who has the highest income (from earnings, benefits, pensions and any other sources)?
ENTER PERSON NUMBER – IF TWO PEOPLE HAVE THE SAME INCOME, ENTER 13
(Codeframe of joint householders)
1-12  Person numbers of household members
13  Two people have the same income

IF HiHNum=13 THEN

[JntEldA]
ENTER PERSON NUMBER OF THE ELDEST JOINT HOUSEHOLDER FROM THOSE WITH THE HIGHEST INCOME.
ASK OR RECORD.
(Codeframe of joint householders)
1-12  Person numbers of household members

IF HiHNum=Don't know or Refused

[JntEldB]
ENTER PERSON NUMBER OF THE ELDEST JOINT HOUSEHOLDER.
ASK OR RECORD.
(Codeframe of joint householders)
1-12  Person numbers of household members

[HRP]*
INTERVIEWER: THE HOUSEHOLD REFERENCE PERSON IS:
(Displays name of Household Reference Person)
PRESS <1> AND <Enter> TO CONTINUE.

[Eligible]*
INTERVIEWER: FOR YOUR INFORMATION THE PEOPLE IN THIS HOUSEHOLD ELIGIBLE FOR AN INDIVIDUAL INTERVIEW ARE:
(List of eligible respondents)
PRESS <1> AND <Enter> TO CONTINUE.

ASK ALL AGED 16+

[OwnORent08]
SHOW CARD A3
In which of these ways do you occupy this accommodation?
PROBE FOR DETAILS
1  Buying it with the help of a mortgage or loan
2  Own it outright
3  Pay part rent and part mortgage
4  Rent (including rents paid by housing benefit)
5  Live here rent free (including rent-free in relative's/friend's property)
IF OwnRnt08= Rent OR Free THEN

[Landlord]
Who is your landlord?
INTERVIEWER: Code first that applies.
If property is rented through an agent code in relation to the property owner NOT the agent.
1 Organisations: the local authority / council / Scottish Homes
2 Organisations: housing association, charitable trust or Local Housing Company
3 Organisations: employer (organisation) of a household member
4 Another organisation
5 Individuals: relative/friend (before you lived here) of a household member
6 Individuals: employer (individual) of a household member
7 Another individual private landlord

ASK ALL

[Car12]¹
In total, how many cars or vans are owned, or are available for private use, by members of your household? Include any company cars or vans available for private use
Range: 0..100.

ASK ALL

[Passm]
Does anyone smoke inside this (house/flat) on most days?
INTERVIEWER: IF ASKED, RESPONDENT SHOULD INCLUDE THEMSELVES AND NON-HOUSEHOLD MEMBERS WHO SMOKE IN THE HOUSE/FLAT, BUT EXCLUDE ANY HOUSEHOLD MEMBERS WHO ONLY SMOKE OUTSIDE OF THE HOUSE/FLAT.
1 Yes
2 No

[SmokHm]²
SHOW CARD A4
Regardless of whether you smoke or not, using this card, what best describes the smoking rules in this (house/flat)? Please think about the people who live with you as well as visitors to your home?
INTERVIEWER: IF RESPONDENT DOES NOT HAVE ANY SMOKING RULES, ASK THEM TO THINK WHAT RULES THEY WOULD APPLY TO SMOKERS IN THEIR HOME:
1 People can smoke anywhere inside this house/flat
2 People can only smoke in certain areas or rooms inside this house/flat (include smoking out of the window and at an open back door)
3 People can only smoke in outdoor areas (e.g. gardens/balconies) of this house/flat
4 People cannot smoke indoors or in outdoor areas of this house/flat

¹ Revised wording and now single question, previously [car] and [numcar].
² New in 2012
IF >1 person in household

[EatTog]

How many times in the last week, that is the seven days ending *(date last Sunday)*, did all or most of the people who live in this household eat a main meal together not including breakfast?

1. Never
2. One or two times
3. Three or four times
4. Five or six times
5. Seven times
6. More than often than this

INTERVIEWER: I'm now going to ask you some questions about your local area.

ASK ALL

[LiveArea]

First, how many years have you lived in your local area? By this I mean the area within about a 15 minute walk from your home?

1. Less than 1 year
2. 1 year but less than 2
3. 2 years but less than 5
4. 5 years but less than 10
5. 10 years or more

IF lived in area 2 years or more (LiveArea >= 3)

[CrimArea]

How much would you say the crime rate in your local area has changed since two years ago? Would you say there is more, less or about the same?

INTERVIEWER: IF ANSWER IS 'MORE' ASK: Is that a lot more or a little more?

IF ANSWER IS 'LESS' ASK: Is that a lot less or a little less?

INTERVIEWER: IF ASKED: There is an interest in finding out if there is a relationship between people's experience of crime and their health and wellbeing:

1. A lot more
2. A little more
3. About the same
4. A little less
5. A lot less

ASK ALL

[PrevCrim]

SHOW CARD A5

How confident are you in the ability of police in your local area to prevent crime?

1. Very confident
2. Fairly confident
3. Not very confident
4. Not at all confident

---

1 This section new in 2012. Note that PrevCrim, ActQuick, DealInc, Investig, SolvCrim and CatchCri are asked in a randomised order.
[ActQuick]
SHOW CARD A5
How confident are you in the ability of police in your local area to respond quickly to appropriate calls and information from the public?
1 Very confident
2 Fairly confident
3 Not very confident
4 Not at all confident

[DealInc]
SHOW CARD A5
How confident are you in the ability of police in your local area to deal with incidents as they occur?
1 Very confident
2 Fairly confident
3 Not very confident
4 Not at all confident

[Investig]
SHOW CARD A5
How confident are you in the ability of police in your local area to investigate incidents after they occur?
1 Very confident
2 Fairly confident
3 Not very confident
4 Not at all confident

[SolvCrim]
SHOW CARD A5
How confident are you in the ability of police in your local area to solve crimes?
1 Very confident
2 Fairly confident
3 Not very confident
4 Not at all confident

[ CatchCri]
SHOW CARD A5
How confident are you in the ability of police in your local area to catch criminals?
1 Very confident
2 Fairly confident
3 Not very confident
4 Not at all confident

* = not on the datafile
IF HQResp = Head of Household OR Spouse/ partner of Head of household

[SrInc]¹
SHOW CARD A6
Please look at this card. There has been a lot of talk about health and income. We would like to get some idea of your household’s income. This card shows various possible sources of income. Can you please tell me which of these you (and your husband/wife/partner) receive?

INTERVIEWER: PROBE FOR ALL SOURCES. CODE ALL THAT APPLY

1 Earnings from employment or self-employment (incl. overtime, tips, bonuses) [SrInc1]
2 State retirement pension [SrInc2]
3 Pension from former employer [SrInc3]
4 Personal pensions [SrInc4]
5 Child Benefit [SrInc5]
6 Job-Seekers Allowance [SrInc6]
7 Income Support [SrInc7]
8 Working Tax Credit, Child Tax Credit or any other Tax Credit [SrInc8]
9 Housing Benefit [SrInc9]
10 Other state benefits [SrInc10]

SHOW CARD A7
This card shows incomes in weekly, monthly and annual amounts. Which of the groups on this card represents (your/you and your husband/wife/partner’s combined) income from all these sources over the last 12 months, before any deductions for income tax, National Insurance contributions, health insurance payments, superannuation payments, etc? Just tell me the number beside the row that applies to (you/your joint incomes).

INTERVIEWER: THIS QUESTION REFERS TO INCOME FROM ALL THE SOURCES LISTED IN CARD A6. PLEASE REFER RESPONDENT BACK TO CARD A6 IF NECESSARY.

INTERVIEWER: ENTER BAND NUMBER. DON’T KNOW = 96, REFUSED = 97.
Range: 1..97

IF 2 Adults in household who are not spouse/partner, or 3 or more adults in household THEN

[OthInc]
Can I check, does anyone else in the household have an income from any source?
1 Yes
2 No

¹ Additional option categories added for 2012
IF OthInc = Yes THEN
[HHInc]
SHOW CARD A7
Thinking of the income of your household as a whole, which of the groups on this card represents the household's total income from all these sources over the last 12 months before any deductions for taxes, National Insurance contributions, health insurance payments, superannuation payments etc? Just tell me the number beside the row that applies.
INTERVIEWER: THIS QUESTION REFERS TO INCOME FROM ALL THE SOURCES LISTED IN CARD A6. PLEASE REFER RESPONDENT BACK TO CARD A6 IF NECESSARY.

ENTER BAND NUMBER. DON'T KNOW = 96, REFUSED = 97.
Range: 1..97

EMPLOYMENT DETAILS OF HOUSEHOLD REFERENCE PERSON

In the last week (that is the 7 days ending date last Sunday) were you doing any of the following, even if only for one hour?
INTERVIEWER: 'Temporarily away' includes away from work ill, on maternity leave, on holiday leave and temporarily laid off (as long as there is still an employment contract). It does not include those who are laid off and no longer have an employment contract.
INTERVIEWER: Code all that apply.
1 Working as an employee (or temporarily away) [HWrkEmp]
2 On a Government sponsored training scheme (or temporarily away) [HGvtSchm]
3 Self employed or freelance (or temporarily away) [HSelfEmp]
4 Working unpaid for your own family's business (or temporarily away) [HWrkFam]
5 Doing any other kind of paid work [HOthWrk]
6 None of the above [HNoneabv]

IF (HRP Age 16 to 64) AND NOT (HGvtSchm) THEN
[HEducCour]
Are you at present (at school) or enrolled on any full-time education course excluding leisure classes? (Include correspondence courses and open learning as well as other forms of full-time education course).
INTERVIEWER: CODE YES IF FULL-TIME STUDENT ON HOLIDAY AND WILL BE STUDYING FULL-TIME WHEN NEXT TERM STARTS. IF RESPONDENT IS STUDYING PART-TIME CODE NO HERE.
1 Yes
2 No

IF ((HWrkFam) OR (HNoneabv)) AND NOT ((HWrkEmp) OR (HGvtSchm) OR (HSelfEmp) OR (HOthWrk)) THEN
[HWk4Look12]
Thinking of the 4 weeks ending (date last Sunday), were you looking for any paid work or Government training scheme at any time in those 4 weeks?
1 Yes
2 No

IF HWk4Look12 = No THEN

---

1 The questions used to establish economic activity of the household reference person changed in 2012.
Are you waiting to take up a job that you have already obtained?
1  Yes
2  No

IF (HWk4Look12 = Yes OR HWaitJb12 = Yes) THEN

If a job or a place on a government scheme had been available in the week ending (date last Sunday), would you have been able to start within 2 weeks?
1  Yes
2  No

IF (HNoneabv) AND (HWk4Look12 = No) AND (HWaitJb12 = No) THEN

May I just check, what was the main reason you did not look for work in the last 4 weeks?
INTERVIEWER: CODE ONE ONLY
1  Waiting for the results of an application for a job/being assessed by a training agent
2  Student
3  Looking after family/home
4  Temporarily sick or injured
5  Long-term sick or disabled
6  Believes no job available
7  Not yet started looking
8  Doesn’t need employment
9  Retired from paid work
10  Any other reason

IF (HNoneabv) AND (HWaitJb12 <> Yes) THEN

Have/has you/name (Household Reference Person) ever been in paid employment or self-employed?

RECORD MINUTES HERE. 0..59
Child physical activity module (2-15)

ASK IF RESPONDENT IS 4 or 5 YEARS OLD
[ChSch]
Can I just check, is (name of child) at school in Primary 1 yet?
1 Yes
2 No

ASK ALL AGED 2-15
[Wlk5Ch]
Now I'd like to ask you about some of the things (you/name of child) (have/has) done in the last week. By last week I mean last (day seven days ago) up to yesterday. In the last week, (have you/has he/she) done a continuous walk that lasted at least 5 minutes (not counting things done as part of school lessons)?
1 Yes
2 No

IF Wlk5Ch = Yes THEN
[DwlkChb]
On how many days in the last week did (you/name of child) do a continuous walk that lasted at least 5 minutes (not counting things done as part of school lessons)?
1 One day
2 Two days
3 Three days
4 Four days
5 Five days
6 Six days
7 Every day

[DayWlkT]
SHOW CARD F1
On each day that (you/name of child) did a walk like this for at least 5 minutes, how long did (you/he/she) spend walking altogether? Please give an answer from this card
INTERVIEWER NOTE: COUNT TOTAL TIME SPENT WALKING. SO TWO WALKS OF 10 MINUTES EACH = 20 MINUTES WALKING
(1 Less than five minutes)
2 5 minutes, less than 15 minutes
3 15 minutes, less than 30 minutes
4 30 minutes, less than 1 hour
5 1 hour, less than 1½ hours
6 1½ hours, less than 2 hours
7 2 hours, less than 2½ hours
8 2½ hours, less than 3 hours
9 3 hours, less than 3½ hours
10 3½ hours, less than 4 hours
11 4 hours or more (please specify how long)

(The answer options used at DayWlkT, on show card F1, are used repeatedly in the child physical activity module. Further mentions of show card F1 will not, therefore, list out the options in full).
IF DayWlkT = 4 hours or more THEN

[WlkHrs]
How long did (you/name of child) spend walking on each day?
RECORD HOURS SPENT BELOW. RECORD MINUTES AT NEXT QUESTION
Range: 4..12

[WlkMin]
RECORD HERE MINUTES SPENT WALKING.
Range: 0..59

ASK ALL AGED 13-15

[ChPace]
Which of the following describes your usual walking pace ... READ OUT ...
1 ... a slow pace,
2 ... a steady average pace,
3 ... a fairly brisk pace,
4 ... or, a fast pace – at least 4 mph?
5 (None of these)

ASK ALL AGED 8-15

[HWkCh]
In the last week (have you/has name of child) done any housework or gardening which involved pulling or pushing, like hoovering, cleaning a car, mowing grass or sweeping up leaves for at least 15 minutes a time?
1 Yes
2 No

IF HWkCh = Yes THEN

[DHWkCh]
On how many days in the last week (have you/has name of child) done any housework or gardening of this type for at least 15 minutes a time?
1 One day
2 Two days
3 Three days
4 Four days
5 Five days
6 Six days
7 Every day

[THWk] (See question [DayWlkT] for full listing of answer options on card F1)

If Aspirin, record dosage as well as name.
Text: maximum 50 characters

[YTake] (Variable names: MedBIA-MedBIA22)
Do you take (name of drug) because of a heart problem, high blood pressure or for some other reason?
1 Heart problem [YTake011-YTake221]
2 High blood pressure [YTake012-YTake222]
3 Other reason [YTake013-YTake223]

[MedBIA] (Variable names: MedBIAB-MedBIA22B)
Have you taken or used (name of drug) in the last 7 days?
1 Yes
2 No

[MedBIC]*
INTERVIEWER CHECK: Any more drugs to enter?
1 Yes
2 No

* = not on the datafile
Blood Pressure

ALL SAMPLE B Age 16+ (EXCEPT PREGNANT WOMEN)

I would now like to measure your blood pressure, which is an important indicator of cardiovascular health. Blood pressure is measured using a monitor and a cuff which I will secure around your right arm. When we are ready to begin I'll press the start button and the cuff will inflate and deflate automatically three times. You will feel some pressure on your arm when the cuff inflates.

Once I have completed the recordings I will tell you what they are.

[BPConst]
INTERVIEWER Does the respondent agree to blood pressure measurement?
1 Yes, agrees
2 No, refuses
3 Unable to measure BP for reason other than refusal

IF BPConst = Yes, agrees THEN
[ConSubX]
May I just check, have you eaten, smoked, drunk alcohol or done any vigorous exercise in the past 30 minutes? CODE ALL THAT APPLY.
1 Eaten [ConSubX1]
2 Smoked [ConSubX2]
3 Drunk alcohol [ConSubX3]
4 Done vigorous exercise [ConSubX4]
5 (None of these) [ConSubX5]

[OMRONNo]
INTERVIEWER RECORD BLOOD PRESSURE EQUIPMENT SERIAL NUMBER:
Range:001..999

[CufSize]
SELECT CUFF AND ATTACH TO THE RESPONDENT'S RIGHT ARM. ASK THE RESPONDENT TO SIT STILL FOR FIVE MINUTES.
RECORD CUFF SIZE CHOSEN.
1 Small adult (17-25 cm)
2 Adult (22-32 cm)
3 Large adult (32-42 cm)

[BPReady]*
INTERVIEWER: ONCE RESPONDENT HAS SAT STILL FOR 5 MINUTES YOU ARE READY TO TAKE THE MEASUREMENTS.
Check that the MODE selector is set to AVG (average) and P-SET Volume (pressure setting) is set to auto
ENSURE THE [READY TO MEASURE] SYMBOL IS SHOWING BEFORE PRESSING THE [START] BUTTON TO START THE MEASUREMENTS.
Sys to BPSWait repeated for up to 3 blood pressure measurements and average is also recorded

[Sys] (variable names sys1om – sys4om)
INTERVIEWER: Take three measurements from right arm.
ENTER (AVERAGE/FIRST/SECOND/THIRD) SYSTOLIC READING (mmHg).
IF READING NOT OBTAINED, ENTER 999.
IF YOU ARE NOT GOING TO GET ANY BP READINGS AT ALL, ENTER 996
Range:001..999

[Dias] (variable names dias1om – dias4om)
ENTER (AVERAGE/FIRST/SECOND/THIRD) DIASTOLIC READING (mmHg).
IF READING NOT OBTAINED, ENTER 999.
Range:001..999

[Pulse] (variable names pulse1om – pulse4om)
ENTER (AVERAGE/FIRST/SECOND/THIRD) PULSE READING (bpm).
IF READING NOT OBTAINED, ENTER 999.
Range:001..999

[MAP] (variable names map1om – map4om)

IF NO FULL MEASUREMENT OBTAINED (at least one ‘999’ reading in all 3 sets of 3 readings) THEN

[YNoBP]
ENTER REASON FOR NOT RECORDING ANY FULL BP READINGS
1 Blood pressure measurement attempted but not obtained
2 Blood pressure measurement not attempted
3 Blood pressure measurement refused

ALL SAMPLE B Age 16+ (EXCEPT PREGNANT WOMEN)

[RespBPS]
Response to Blood Pressure measurements:
1 Three Blood pressure measurements
2 Two Blood pressure measurements
3 One Blood pressure measurements
4 Tried
5 Not tried
6 Refused

* = not on the datafile
IF BLOOD PRESSURE MEASUREMENT REFUSED OR NOT ATTEMPTED, OR FEWER THAN THREE FULL READINGS OBTAINED (IF RespBPS in [Two … Refused]) THEN

[NAttBPD]
RECORD WHY (ONLY TWO READINGS OBTAINED/ONLY ONE READING OBTAINED/READING NOT OBTAINED/READING NOT ATTEMPTED/READING REFUSED/UNABLE TO TAKE READING). CODE ALL THAT APPLY.
0 Problems with PC [NAttBPD0]
1 Respondent upset/anxious/nervous [NAttBPD1]
2 Error reading [NAttBPD2]
5 Other reason(s) (specify at next question) [NAttBPD5]
6 Problems with cuff fitting/painful [NAttBPD6]
7 Problems with equipment (not error reading) [NAttBPD7]

IF NattBP = Other THEN

[OthNBP]*

ENTER THESE ON RESPONDENT’S MEASUREMENT RECORD CARD (COMPLETE NEW RECORD CARD IF REQUIRED).

* = not on the datafile
ADVICE TO RESPONDENTS ON BLOOD PRESSURE READING:

IF Systolic reading >179 OR Diastolic reading >114 THEN:
TICK THE CONSIDERABLY RAISED BOX AND READ OUT TO RESPONDENT: Your blood pressure is high today. Blood pressure can vary from day to day and throughout the day so that one high reading does not necessarily mean that you suffer from high blood pressure. You are strongly advised to visit your GP within 5 days to have a further blood pressure reading to see whether this is a once-off finding or not.

IF Systolic reading 160-179 OR Diastolic reading 100-114 THEN:
TICK THE RAISED BOX AND READ OUT TO RESPONDENT: Your blood pressure is a bit high today. Blood pressure can vary from day to day and throughout the day so that one high reading does not necessarily mean that you suffer from high blood pressure. You are advised to visit your GP within 2-3 weeks to have a further blood pressure reading to see whether this is a once-off finding or not.

IF Systolic reading 140-159 OR Diastolic reading 85-99 THEN:
TICK THE MILDLY RAISED BOX AND READ OUT TO RESPONDENT: Your blood pressure is a bit high today. Blood pressure can vary from day to day and throughout the day so that one high reading does not necessarily mean that you suffer from high blood pressure. You are advised to visit your GP within 3 months to have a further blood pressure reading to see whether this is a once-off finding or not.

IF Systolic reading <140 AND Diastolic reading <85 THEN:
TICK THE NORMAL BOX AND READ OUT TO RESPONDENT: Your blood pressure is normal.
Waist Circumference

ASK ALL SAMPLE B 16+ (EXCEPT PREGNANT WOMEN)

[WHMod]*
INTERVIEWER: NOW FOLLOWS THE WAIST CIRCUMFERENCE MEASUREMENT. ENTER ‘1’ TO CONTINUE

1 Continue

[WIntro]
Now I would like to measure the circumference of your waist. The waist circumference is a measure of the distribution of body fat, provides important additional information and is a predictor of health risk. You will need to be standing for this measurement. I will ask you to identify where on your body your tummy button is, and I will then ask you to place this measuring tape around your waist, over your clothing, at the level of your tummy button. Once the tape measure is level around your waist I will ask you to take a normal breath and then breathe out. I will then record the measurement. I will take at least two measurements. Are you willing for me to take this measurement?

INTERVIEWER CODE:

1 Respondent agrees to have waist measured
2 Respondent refuses to have waist measured
3 Unable to measure waist for reason other than refusal

IF (WIntro=Agree) THEN
Repeat for up to three waist measurements.
Third measurement taken only if difference between first two measurements is greater than 3cm.

[Waist] (variable names Waist1 to Waist3)
INTERVIEWER: MEASURE THE WAIST CIRCUMFERENCES TO THE NEAREST MM. ENTER (FIRST/SECOND/THIRD) WAIST MEASUREMENT IN CENTIMETRES (Remember to include the decimal point).
IF MEASUREMENT NOT OBTAINED, ENTER ‘999.9’.
Range: 45.0..1000.0

IF WIntro in [1..3] THEN
(computed from WIntro, Waist)

[RespW]
Response to waist measurements:
1 Both measurements obtained
2 One measurement obtained
3 Refused
4 Not tried

IF (Waist1 = 999.9) OR (Waist2 = 999.9) THEN
[YNoW]
ENTER REASON FOR NOT GETTING BOTH MEASUREMENTS
1 Both measurements refused
2 Attempted but not obtained
3 Measurement not attempted

* = not on the datafile
IF NO OR ONE MEASUREMENT OBTAINED ((WHIntro=Refuse OR Unable) OR Only one waist measurement obtained) THEN
  [WPNABM]
  GIVE REASON(S) (FOR REFUSAL/WHY UNABLE/FOR NOT OBTAINING MEASUREMENT/FOR NOT ATTEMPTING/WHY ONLY ONE MEASUREMENT OBTAINED). CODE ALL THAT APPLY.
  1 Respondent is in a wheelchair          [WPNABM1]
  2 Respondent is confined to bed          [WPNABM2]
  3 Respondent is too stooped              [WPNABM3]
  4 Respondent did not understand the procedure [WPNABM4]
  5 Respondent is embarrassed/sensitive about their size [WPNABM5]

INTERVIEWER: PLEASE CIRCLE CODE CODE 2 ‘NO’ AT QUESTION 9 IN THE CONSENT BOOKLET

* = not on the datafile
ASK ALL SAMPLE B 16+
[CASIIInt]*
I now have some questions for you to answer yourself, on the computer. The questions cover topics to do with depression, anxiety and self-harm. When you have finished the computer will lock away your answers and no one else will be able to see them, including me.
Instructions about which keys to press will be shown on the computer screen. If you press the wrong key I can tell you how to change the answer. When you get to the end, please tell me and we will complete the rest of the interview with me asking you questions again.

INTERVIEWER: Only where necessary, ask respondent if they would like you to read the questions out to them.
Please code whether the self-completion is accepted or not:
1 Self-completion accepted by respondent
2 Self-completion to be read out by interviewer
3 Self-completion refused

If CASIIInt=3 (refused)
[SCompNH]
INTERVIEWER: Record why the computer self-completion was not completed.
CODE ALL THAT APPLY
1 Eyesight problems [SCompNH1]
2 Language problems [SCompNH2]
3 Reading/writing/comprehension problems [SCompNH3]
4 Doesn't like computers [SCompNH4]
5 Respondent bored/fed up/tired [SCompNH5]
6 Questions too sensitive/invasion of privacy [SCompNH6]
7 Too long/too busy/taken long enough already [SCompNH7]
8 Refused to complete self-completion (no other reason given) [SCompNH8]
9 Other (SPECIFY) [SCompNH9]

{If CASI NOT REFUSED}
[CASIIInst]*
INTERVIEWER: If the respondent is happy to do the self-completion themselves - hand over the computer now. Otherwise keep interviewing.

[DashInt]*
The next questions are for you to answer yourself. They all ask you to choose an answer from those listed on the screen. Please choose your answer by pressing the number next to the answer you want to give and then press the large key with the red sticker (the enter key). You don't have to answer every question - if you want to skip one the interviewer will tell you how to do this. Please ask the interviewer if you want any help. Now press 1 and then the key with the red sticker to continue.

[AnxiInt]*
The next few questions ask about how you've been feeling lately and if you've been feeling depressed, worried or anxious. Press 1 and then the key with the red sticker to continue.
Anxiety

[J1SC]
Have you been feeling anxious or nervous in the past month?
1 Yes, anxious or nervous
2 No

IF J1SC = No THEN

[J2SC]
In the past month, did you ever find your muscles felt tense or that you couldn't relax?
1 Yes
2 No

ALL

[J3SC]
Some people have phobias; they get nervous or uncomfortable about specific things or situations when there is no real danger. For instance they may get extremely anxious when in confined spaces, or they may have a fear of heights. Others become nervous at the sight of things like blood or spiders.
In the past month have you felt anxious, nervous or tense about any specific things when there was no real danger?
1 Yes
2 No

IF RESPONDENT HAS EXPERIENCED ANXIETY AND PHOBIA ((IF J1SC=Yes AND J3SC=Yes) OR (J2SC=Yes AND J3SC=Yes)) THEN

[J5SC]
In the past month, when you felt anxious/nervous/tense, was this always brought on by the phobia about some specific situation or thing or did you sometimes feel generally anxious/nervous/tense?
1 Always brought on by phobia
2 Sometimes generally anxious

IF J5SC = Sometimes generally anxious THEN

[J6SC]
The next questions are concerned with general anxiety/nervousness/tension only.
On how many of the past seven days have you felt generally anxious/nervous/tense?
1 4 days or more
2 1 to 3 days
3 None

IF RESPONDENT HAS EXPERIENCED GENERAL ANXIETY ONLY (IF (J1SC=Yes AND J3SC=No) OR (J2SC=Yes AND J3SC=No)) THEN

[J7SC]
On how many of the past seven days have you felt generally anxious/nervous/tense?
1 4 days or more
2 1 to 3 days
3 None
IF RESPONDENT HAS EXPERIENCED ANXIETY FOR AT LEAST 1 DAY (IF J6SC IN [1..2] OR J7SC IN [1..2]) THEN

[J8SC]
In the past week, has your anxiety/nervousness/tension been:
RUNNING PROMPT
1 ...very unpleasant
2 ...a little unpleasant
3 ...or not unpleasant?

[J9SC]
In the past week, when you've been anxious/nervous/tense, have you had any of the symptoms shown below?
1 Heart racing or pounding
2 Hands sweating or shaking
3 Feeling dizzy
4 Difficulty getting your breath
5 Butterflies in stomach
6 Dry mouth
7 Nausea or feeling as though you wanted to vomit

IF RESPONDENT HAS EXPERIENCED ANY OF THE SYMPTOMS LISTED IF J9SC=Yes) THEN

[J9A...]
Which of these symptoms did you have when you felt anxious/nervous/tense?
CODE ALL THAT APPLY
1 Heart racing or pounding       [J9A1SC]
2 Hands sweating or shaking        [J9A2SC]
3 Feeling dizzy          [J9A3SC]
4 Difficulty getting your breath        [J9A4SC]
5 Butterflies in stomach         [J9A5SC]
6 Dry mouth          [J9A6SC]
7 Nausea or feeling as though you wanted to vomit     [J9A7SC]

IF RESPONDENT HAS EXPERIENCED ANXIETY FOR AT LEAST 1 DAY (IF J6SC IN [1..2] OR J7SC IN [1..2]) THEN

[J10SC]
Have you felt anxious/nervous/tense for more than 3 hours in total on any one of the past seven days?
1 Yes
2 No

[J11SC]
How long have you had these feelings of general anxiety/nervousness/tension as you described?
1 Less than 2 weeks
2 2 weeks but less than 6 months
3 6 months but less than 1 year
4 1 year but less than 2 years
5 2 years or more

* = not on the datafile
Depression

[G1SC]
Almost everyone becomes sad, miserable or depressed at times.
Have you had a spell of feeling sad, miserable or depressed in the past month?
1 Yes
2 No

[G2SC]
During the past month, have you been able to enjoy or take an interest in things as much as you usually do?
1 Yes
2 No/no enjoyment or interest

IF G1SC = Yes THEN

[G4SC]
In the past week have you had a spell of feeling sad, miserable or depressed?
1 Yes
2 No

IF G2SC = No THEN

[G5SC]
In the past week have you been able to enjoy or take an interest in things as much as usual?
1 Yes
2 No/no enjoyment or interest

IF (G4SC = Yes) OR (G5SC = No/no enjoyment or interest) THEN

[G6SC]
Since last [Sunday / Monday / Tuesday / Wednesday / Thursday / Friday / Saturday] on how many days have you felt [depressed or unable to take an interest in things / sad, miserable or depressed / unable to enjoy or take an interest in things]?
1 4 days or more
2 1 to 3 days
3 None

[G7SC]
Have you felt [depressed or unable to take an interest in things / sad, miserable or depressed / unable to enjoy or take an interest in things] for more than 3 hours in total (on any day in the past week)?
1 Yes
2 No

[G9SC]
In the past week when you felt sad, miserable or depressed/unable to enjoy or take an interest in things, did you ever become happier when something nice happened, or when you were in company?
1 Yes, at least once
2 No
[G10SC]
How long have you been feeling sad, miserable or depressed/unable to enjoy or take an interest in things as you have described?
1  Less than 2 weeks
2  2 weeks but less than 6 months
3  6 months but less than 1 year
4  1 year but less than 2 years
5  2 years but less than 5 years
6  5 years but less than 10 years
7  10 years or more
Self Harm

[DSHIntro]*
There may be times in everyone’s life when they become very miserable and depressed and may feel like taking drastic action because of these feelings
1 Continue

CARD Q2

Choose **ONE** section from A to F, then choose **ONE** option which best describes your ethnic group or background.

**A  White**  
Scottish  
Other British  
Irish  
Gypsy/Traveller  
Polish  
Other white ethnic group (please say what)

**B  Mixed or multiple ethnic group**  
Any mixed or multiple ethnic groups (please say what)

**C  Asian, Asian Scottish or Asian British**  
Pakistani, Pakistani Scottish or Pakistani British  
Indian, Indian Scottish or Indian British  
Bangladeshi, Bangladeshi Scottish or Bangladeshi British  
Chinese, Chinese Scottish or Chinese British  
Other (please say what)

**D  African**  
African, African Scottish or African British  
Other (please say what)

**E  Caribbean or Black**  
Caribbean, Caribbean Scottish or Caribbean British  
Black, Black Scottish or Black British  
Other (please say what)

**F  Other ethnic group**  
Arab, Arab Scottish or Arab British  
Other, (please say what)
CARD Q3

1 Self-employed, with a business with 25 or more employees
2 Self-employed, with a business with fewer than 25 employees
3 Self-employed, in a business with no employees
4 A manager of 25 or more staff
5 A manager of fewer than 25 staff
6 Foreman or supervisor
7 An employee, not a manager
CARD Q4

1 High Blood Pressure
2 Angina
3 Heart Attack
4 Stroke
5 Other Heart Trouble
6 Diabetes

The questions in this booklet can be answered by ticking the box below the answer that applies. You do not have to answer every question.

**Example:**

Do you feel that you lead a...

- Very healthy life
- Fairly healthy life
- Not very healthy life
- An unhealthy life

Tick ONE box on each row.
Strengths and Difficulties Questionnaire

For each item, please mark the box for Not True, Somewhat True or Certainly True. It would help us if you answered all items as best you can even if you are not absolutely certain or the item seems daft!

Please give your answers on the basis of the child's behaviour over the last six months.

<table>

Overall, do you think that your child has difficulties in one or more of the following areas: emotions, concentration, behaviour or being able to get on with other people?

- No [ ] Go to questions on page 3
- Yes – minor difficulties [ ]
- Yes – definite difficulties [ ] Go to next question
- Yes – severe difficulties [ ]

If you have answered “Yes”, please answer the following questions about these difficulties:

**How long have these difficulties been present?**

<table>
<thead>
<tr>
<th>Less than a month</th>
<th>1-5 months</th>
<th>6-12 months</th>
<th>Over a year</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>[ ]</td>
<td>[ ]</td>
<td>[ ]</td>
</tr>
</tbody>
</table>

**Do the difficulties upset or distress your child?**

<table>
<thead>
<tr>
<th>Not at all</th>
<th>Only a little</th>
<th>Quite a lot</th>
<th>A great deal</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>[ ]</td>
<td>[ ]</td>
<td>[ ]</td>
</tr>
</tbody>
</table>

**Do the difficulties interfere with your child’s everyday life in the following areas?**

- Home life [ ] Only a little [ ] Quite a lot [ ] A great deal [ ]
- Friendships [ ]
- Classroom learning [ ]
- Leisure activities [ ]

**Do the difficulties put a burden on you or the family as a whole?**

<table>
<thead>
<tr>
<th>Not at all</th>
<th>Only a little</th>
<th>Quite a lot</th>
<th>A great deal</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>[ ]</td>
<td>[ ]</td>
<td>[ ]</td>
</tr>
</tbody>
</table>
And now some questions about physical activity

The government advises that young children of pre-school age who are capable of walking without help should spend a certain amount of time being physically active. This includes light or more energetic activities such as walking or skipping, riding a bike, and running and chasing games.

How much time per day do you think under fives who are able to walk are advised to spend doing this?

Please write in time (You can either write your answer in minutes, hours or both)

<table>
<thead>
<tr>
<th>Hours</th>
<th>Minutes</th>
<th>Do not have a child this age</th>
</tr>
</thead>
</table>

The government also advises that children and young people (aged 5 – 18) should spend a certain amount of time doing moderate physical activity to help them stay healthy. This includes bike riding, playground activities, swimming, playing tennis or any other activity that makes them breathe slightly faster than usual.

How much time per day do you think those aged 5-18 are advised to spend doing this?

Please write in time (You can either write your answer in minutes, hours or both)

<table>
<thead>
<tr>
<th>Hours</th>
<th>Minutes</th>
<th>Do not have a child this age</th>
</tr>
</thead>
</table>

Thank you for answering these questions.
Please give the booklet back to the interviewer.
Scottish Health Survey 2014

Booklet for 13-15 year olds

In Confidence

- Here are some questions for you to answer on your own.
- We are interested in your honest answers.
- We will not tell anyone what your answers are.
- You do not have to answer all the questions. If you want to miss a question, please just leave it out and move to the next one.
- Look at the instructions on the next page and read what to do.
- Ask the interviewer for help if you do not understand a question or are not sure what to do.

Thank you for taking part in this survey
How to answer these questions

- Please read each question carefully
- All of the questions can be answered by putting a tick in the box next to the answer that applies to you like this

  Yes  ☑

  No  

291
General health over the last few weeks

Please read this carefully:
We should like to know how your health has been in general over the past few weeks. Please answer ALL the questions by ticking the box under the answer which you think most applies to you.

Now go to Q27 on page 5 ↓

Warwick-Edinburgh Mental Well-Being Scale (WEMWS)
© NHS Health Scotland, University of Warwick and University of Edinburgh, 2006, all rights reserved.
And now a question about physical activity.

Q27 The government *advises people to spend* a certain amount of time doing moderate physical activity to help them stay healthy. This includes bike riding, swimming, playing tennis or any other activity that makes them breathe slightly faster.

How much time *per day* do you think people *your age* are *advised to spend* doing this?

Please write in time (you can either write your answer in minutes, hours or both).

Thank you for answering these questions.
Please give the booklet back to the interviewer.
How to fill in this questionnaire

A Most of the questions on the following pages can be answered by simply ticking the box below or alongside the answer that applies to you. You do not have to answer every question.

Example:
Do you feel that you lead a
- Very healthy life
- Fairly healthy life
- Not very healthy life
- An unhealthy life

Tick ONE box

B Sometimes you are asked to write in a number or the answer in your own words. Please enter numbers as figures rather than words.

Example:
Write in no.

C On most pages you should answer ALL the questions but sometimes you will find an instruction next to the box you have ticked telling you to go to another question. By following the instructions carefully you will miss out questions which do not apply to you.

Example:
Tick ONE box
- Yes ➔ Go to Q4
- No ➔ Go to Q5
SMOKING

Q1  Have you ever smoked a cigar or a pipe?  
Tick ALL that apply

Yes – cigar  \[1\]  Go to Q2 \(\downarrow\)

Yes – pipe  \[2\]

No  \[3\]

Q2  Have you ever smoked a cigarette?  
Tick ONE box

Yes  \[1\]  Go to Q3 \(\downarrow\)

No  \[2\]  Go to Q7 on page 2 \(\rightarrow\)

Q3  How old were you when you first tried smoking a cigarette, even if it was only a puff or two?  
Write in how old you were then  \[\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\]  Go to Q4 \(\downarrow\)

Q4  Do you smoke cigarettes nowadays?  
Tick ONE box

Yes  \[1\]  Go to Q6a \(\downarrow\)

No  \[2\]  Go to Q5 \(\downarrow\)

Q5  Did you smoke cigarettes regularly or occasionally?  
Tick ONE box

Regularly, that is at least one cigarette a day  \[1\]  Go to Q7 on page 2 \(\rightarrow\)

Occasionally  \[2\]

I never really smoked cigarettes, just tried them once or twice  \[3\]

CURRENT SMOKERS

Q6a  About how many cigarettes a day do you usually smoke on weekdays?  
Write in number smoked a day  \[\_\_\_\_\_\_\_\_\_]  Go to Q6b \(\downarrow\)

Q6b  And about how many cigarettes a day do you usually smoke at weekends?  
Write in number smoked a day  \[\_\_\_\_\_\_\_\_\_]  Go to Q7 on page 2 \(\rightarrow\)
EVERYONE PLEASE ANSWER

Q7 Have you ever used an electronic cigarette (e-cigarette)?

Tick ONE box

Yes 1 Go to Q8 ▼
No 2 Go to Q9 ▼

Q8 Do you use electronic cigarettes (e-cigarettes) at all nowadays?

Tick ONE box

Yes 1 Go to Q9 ▼
No 2

Q9 Are you regularly exposed to other people’s tobacco smoke in any of these places?

Please tick all boxes which apply

Tick ALL that apply

At home 1 Go to Q10 ▼
At work 2
In other people’s homes 3 Go to Q10 ▼
In cars, vans etc 4
Outside of buildings (e.g. pubs, shops, hospitals) 5
In other public places 6
No, none of these 7 Go to Q11 on page 3 ➤

Q10 Does this bother you at all?

Tick ONE box

Yes 1
No 2

NOW GO TO THE QUESTIONS ON THE NEXT PAGE  ➤
DRINKING

Q11  Do you ever drink alcohol nowadays, including drinks you brew or make at home?

Tick ONE box

Yes 1  Go to Q14 ↓

No 2  Go to Q12 ↓

Q12  Just to check, does that mean you never have an alcoholic drink nowadays, or do you have an alcoholic drink very occasionally, perhaps for medicinal purposes or on special occasions like Christmas and New Year?

Tick ONE box

Very occasionally 1  Go to Q14 ↓

Never 2  Go to Q13 ↓

Q13  Have you always been a non-drinker or did you stop drinking for some reason?

Tick ONE box

Always a non-drinker 1  Go to Q39 on page 15 ➔

Used to drink but stopped 2

Q14  How old were you the first time you ever had a proper alcoholic drink – a whole drink, not just a sip?

Write in how old you were then  Go to the next page ➔
The next few questions are concerned with different types of alcoholic drink. Please tick the box underneath the answer that best describes how often you usually drank each of them in the last 12 months. For the ones you drank, write in how much you usually drank on any one day. **EXCLUDE ANY NON-ALCOHOLIC OR LOW-ALCOHOL DRINKS, EXCEPT SHANDY.**

### EXAMPLE

**A** How often have you had this type of drink in the past year?

Tick **ONE** box

Q26 Please think about the day in the last week on which you drank the most. (If you drank the same amount on more than one day, please answer about the most recent of those days.)

From this list, please tick all the types of alcoholic drink which you drank on that day. For the ones you drank, write in how much you drank on that day. EXCLUDE NON-ALCOHOLIC OR LOW-ALCOHOL DRINKS, EXCEPT SHANDY.

<table>
<thead>
<tr>

</tbody>
</table>
| Betting exchange
  This is where you lay or back bets against other people using a betting exchange. There is no bookmaker to determine the odds. This is sometimes called 'peer to peer' betting. |     |    |
| Betting on horse races in a bookmaker's, by phone or at the track       |     |    |
| Betting on dog races in a bookmaker's, by phone or at the track         |     |    |
| Betting on sports events in a bookmaker's, by phone or at the venue     |     |    |
| Betting on other events in a bookmaker's, by phone or at the venue      |     |    |
| Spread-betting
  In spread-betting you bet that the outcome of an event will be higher or lower than the bookmaker's prediction. The amount you win or lose depends on how right or wrong you are. |     |    |
| Private betting, playing cards or games for money with friends, family or colleagues |     |    |
| Another form of gambling in the last 12 months                          |     |    |

IF YOU TICKED ‘YES’ FOR ANY OF THE ACTIVITIES AT Q38, PLEASE GO TO Q39 ON PAGE 9
OTHERWISE GO TO Q58 ON PAGE 11.
For the next set of questions about gambling, please indicate the extent to which each one has applied to you in the last 12 months.

**Q39** When you gamble, how often do you go back another day to win back money you lost?

Q60 What other method of contraception do you or your partner use? Write in:

Now go to Q63 on page 12
ANSWER IF YOU ARE CURRENTLY SEXUALLY ACTIVE BUT YOU OR YOUR PARTNER ARE NOT USING CONTRACEPTION CURRENTLY

Q61  Here is a list of reasons why people do not use any method of contraception. Which is the main reason that currently applies to you or your partner?

Tick ONE box

- [ ] I am / my partner is trying to become pregnant or is already pregnant  
- [ ] I am / my partner is unlikely to conceive because of the menopause  
- [ ] I am / my partner is unlikely to conceive because of infertility  
- [ ] Against my faith/beliefs  
- [ ] I am having sex with someone of the same sex  
- [ ] I don’t like contraception / find methods unsatisfactory  
- [ ] My partner doesn’t like – or won’t use – contraception  
- [ ] Don’t know where to obtain contraceptives / advice  
- [ ] Find access to contraceptive services difficult  
- [ ] Some other reason  

Go to Q62

Q62  Please write in other reason:

[ ]

Now go to Q63

EVERYONE PLEASE ANSWER

Q63  And now a question about physical activity. The government advises people to spend a certain amount of time doing moderate physical activity to help them stay healthy. This includes brisk walking, heavy gardening or any other activity that makes you breathe slightly faster than usual. How much time per week do you think people your age are advised to spend doing this?  

Please write in time (You can either write your answers in minutes, hours or both).

[ ] Hours  [ ] Minutes

EVERYONE PLEASE ANSWER

Q64  Which of the following options best describes how you think of yourself?  

Tick ONE box

- [ ] Heterosexual or Straight  
- [ ] Gay or Lesbian  
- [ ] Bisexual  
- [ ] Other

    DD [ ] MM [ ] YYYY [ ] [ ] [ ] [ ]
I consent to a trained ScotCen Social Research interviewer collecting a sample of my saliva on behalf of the Scottish Government

a) I have read and understood the Information for Participants leaflet and understand that I will be asked to provide a saliva sample collected by dribbling into a small container that will then be sealed and packaged. This measurement will take approximately three (3) minutes to complete.

b) The saliva sample will be sent to a secure storage facility where it will be analysed for cotinine. I understand that:
   i. The sample and related information will be coded to ensure that my personal identity is not revealed to researchers carrying out scientific analysis
   ii. Links to my name and/or contact details will not be made at any time
   iii. No personal test results from my saliva sample will be given to me
   iv. The saliva sample will only be tested for cotinine, a derivative of nicotine. It will not be tested for other substances like drugs or alcohol or for DNA testing
   v. The sample will be destroyed after the analysis has been carried out

c) The interviewer has explained the procedure, and I have had an opportunity to discuss this with him/her.

SCOTTISH HEALTH SURVEY

Scottish Health Records
(Children 0-15)

- The National Health Service (NHS) maintains routine medical and other health records on all patients who use their services. These records include:
  - In-patient and out-patient visits to hospital, length of stay and waiting times.
  - Information about specific medical conditions such as cancer, heart disease and diabetes.
  - Details about registration with a general practitioner, and when people pass away, the date and cause of their death.
- We would like to ask for your consent to link your NHS health records with your survey answers.
- To link this information we need to send your name, address and date of birth to the Information Services Division (ISD) of NHS Scotland so they can identify your health records.
- By linking this information with the interview data the research is more useful as we can look at how people’s lifestyle and circumstances can have an impact on their future health and use of hospital services.
- This information will be confidential and used for statistical and research purposes only. The information will not identify you so it cannot be used by anyone treating you as a patient.
- By signing this form you are only giving permission for the linking of this information to routine administrative data and nothing else.
- You can cancel this permission at any time in the future by writing to: ScotCen Social Research, 73 Lothian Road, Edinburgh, EH3 9AW. You do not need to give a reason to cancel this.

Your consents

I, (name) _________________________________

1 HOW TO USE THIS MANUAL

This manual sets out the protocols and procedures for all bio-physical measurements and samples that nurses or interviewers may take across NatCen surveys.

Protocols are of paramount importance in collecting data and measurements. Having such strict protocols and procedures means that the information that is collected from respondents is valid, reliable and consistently obtained. It further allows the results to be compared across various factors such as age and location and ultimately means that the highest quality research is conducted and accurate information is given to our clients and policy makers.

The protocols and procedures outlined in this manual have been used by NatCen on various occasions and have been found to be successful. Not only do they provide valid and reliable results but they are also the safest way for the measures to be conducted for both the respondents and the interviewers or nurses.

All protocols and procedures in this manual must be strictly adhered to and must be used in conjunction with the relevant project instructions which provide additional information such as eligibility and exclusion criteria, which are project specific.

For the purposes of this manual an adult is someone who is aged 16 years and older, and a child is aged 15 years or younger. For information on working with different types of people refer to the current version of the NatCen Operations Handbook.

This manual is to be used as an instruction book and a quick reference guide when undertaking Fieldwork.
2 POINTS TO NOTE BEFORE STARTING

2.1 Consent

The issue of consent is of key concern in any of the projects conducted by NatCen. We are required to seek ethical approval for all of the projects we undertake involving biophysical measures or samples, and as a result the protocols pertaining to consent within this manual are based on recommendations by an external medical Ethics Committee.

Consent must always be obtained for every measurement and sample taken. As a general guideline the measurements require verbal consent, while the samples, which are more invasive, require written consent. Written consent may also be asked for the storage of samples.

Based on the external ethics committee recommendations, obtaining consent varies according to age:

*Respondents aged 16 years and older may give consent on their own behalf.*

We recognise that respondents aged 16 and 17 years are legally classed as minors, however the external ethics committee recommends that respondents of this age are competent enough to make their own decisions in regards to participating in the survey measurements and samples. Note that if 16-17 year olds are living with their parents you should ensure that their parents are aware of what you will be doing.

All of the measurements and samples outlined require at least verbal consent. Unless otherwise stated, in the protocol for a particular measurement / sample, only verbal consent is required. If written consent is required it will be clearly stated in the protocol and the process by which that consent must be gained.

2.2 Exclusion criteria and eligibility

Most of the procedures in this manual have exclusion criteria that need to be considered when conducting a measurement or taking a sample. These criteria are listed under each measurement and sample heading. It is important that the exclusion criteria are followed as they help to ensure the safety of, and prevent injury to both the respondent and the nurse or interviewer.

*Note* that no measurements or samples are taken from pregnant women, due to the altered physiology that occurs in pregnancy.

Each of the measurements and samples also has eligibility rules to consider. These rules are not listed here as they differ among the surveys. The eligibility rules can be found in the project specific instructions for each survey.

2.3 General equipment care

All of the measurements and samples require some type of equipment. Please take care when using the equipment. In each protocol is a list of the equipment required as well as information on how to use it. Please follow these guidelines.
This equipment is expensive and most of it is easily damaged if it is not transported and/or stored correctly. Please use the bags and boxes provided to store and transport the equipment as it will help to prevent it from being damaged.

Calibrated instruments are particularly fragile and if they are knocked it could cause them to provide inaccurate measurements. Please handle the calibrated instruments with care and maintain them according to guidelines in the manual.

Always ensure that the equipment is in good working order before you go to an interview e.g. batteries are fully charged, and that you are carrying a set of spare batteries with you.

If you suspect that any of the equipment is faulty and/or damaged, please report this to the Equipment Supervisor at Brentwood who will be able to advise you on what action to take.

2.4 Infection Control and Manual Handling Issues

NatCen follows ‘best practice’ principles when working in the Field, specifically to reduce the risks of cross infection when visiting multiple households and individuals to conduct field work and also to reduce the risks of manual handling injuries to nurses and interviewers when transporting and using the equipment provided.

Each of the protocols therefore highlights any special cross infection procedure to follow and any specific manual handling issue to be aware of. Please ensure you follow these instructions and if you experience any problems please contact the Equipment Supervisor or your Nurse / Interviewer Supervisor for further advice or help.

2.5 Recording measurements

The anthropometric measurements require the results to be recorded in the metric format. Within the metric system, there are 10 millimetres (mm) in a centimetre (cm) and 100 centimetres (cm) in a metre (m). CAPI requires that measurements be recorded in the form 123.4cm (to one decimal place only). If a reading falls between two millimetres, it should be rounded and recorded to the nearest even millimetre. For example if a respondent has a height reading that falls between 166.7 and 166.8, the reading of 166.8 should be recorded. Similarly, if the reading falls between 166.6 and 166.7, 166.6 should be recorded. By doing it this way, we ensure that our final data is not biased due to always rounding up or down.

2.6 Respondent feedback

Most surveys provide immediate feedback to respondents of some measurements by recording the results on a Measurement Record Card. If the respondent wishes to know their results they should be recorded here.

Please do not comment on the meaning of a respondent’s results in general or on their results in relation to other people taking part in the survey. The only exception to this rule is the blood pressure measurement where some comments can be given to the respondent, according to the instructions outlined in the blood pressure protocol.
3 HEIGHT MEASUREMENT

3.1 Introduction
The height measurement is a measure of anthropometry, which provides information on the size and proportions of the human body. When taken in conjunction with other anthropometric measures it is an indicator of, and can predict, the nutritional status, performance, health and survival of a population and can thus be used to determine public health policies. Moreover, height is often used as an indicator of people’s quality of life. This is based on evidence that final height is a combination of genetic and environmental factors, where a taller population is indicative of a better quality of life due to access to health services and nutrition.

3.2 Exclusion criteria
Respondents are excluded from the height measurement if:
- They are pregnant
- They are too stooped to obtain a reliable measurement
- After a discussion with the respondent it becomes clear that they are too unsteady on their feet
- They are chair bound
- If the respondent finds it painful to stand or sit up straight

3.3 Equipment
You will need:
- A portable stadiometer (see figure 1 below) (base plate, upright rods, head plate and stabilisers)
- A Frankfort Plane card
- Milton wipes

![Figure 1 The stadiometer](image)
3.3.1 Caring for the stadiometer

The stadiometer will be sent to you in a box. Always store the stadiometer in the box when it is not in use and always pack the stadiometer carefully in the box whenever you are sending it on by courier. Inside the box with the stadiometer is a special bag that you should use for carrying the stadiometer around when you are out on assignment. You may also request a wheeled holdall from the Equipment Supervisor at Brentwood to transport the stadiometer and weighing scales.

The rods

There are four plastic connecting rods marked with a measuring scale divided into centimetres and then further subdivided into millimetres. They should be put together in the correct order with the same coloured markings running along each side. The rods are made of plastic and are susceptible to bending if any pressure is put on them. Be careful not to damage the corners of the rods as this will prevent them from fitting together properly and will lead to a loss of accuracy in the measurements.

The base plate

Be careful not to damage the corners of the base plate as this could lead to a loss of accuracy in the measurements.

Protruding from the base plate is a socket into which you attach the rods in order to assemble the stadiometer. Damage to the corners of this socket may mean that the rods do not stand at the correct angle to the base plate when the stadiometer is assembled and the measurements could be affected.

The head plate

The head plate is made up of the blade and the cuff. The blade is the part that rests on the respondent’s head while the measurement is taken and the cuff is the part of the head plate that slips over the measurement rods and slides up and down the rods. The whole unit is made of plastic and will snap if subjected to excessive pressure. Grasp the head plate by the cuff whenever you are moving the head plate up or down the rods, this will prevent any unnecessary pressure being applied to the blade which may cause it to break.

3.3.2 Assembling the stadiometer

Practise assembling your stadiometer before you visit a respondent’s home.

You will receive your stadiometer with the four rods stored into the base plate and the head plate attached to the base plate so that the blade lies flat against the base plate. Once working you should store the head plate in the jiffy bag given to you to protect it further – as this is the component likely to break first with use.

Note that the rods are numbered/have symbols to guide you through the stages of assembly. (There is also an asset number identified on the base plate, this is the serial
number of the stadiometer which is logged out to you). The stages of assembly are as follows:

1. Lie the base plate flat on the floor area where you are to conduct the measurements. It should be as flat as possible, ideally on an uncarpeted floor or with a thin carpet; you should avoid a deep pile carpet or rug if at all possible.

2. Take the rod marked with the arrows showing it’s position into the base plate. Making sure the measuring scale is on the right hand side of the rod as you look at the stadiometer face on, place rod into the base plate socket. It should fit snugly without you having to use force.

3. Place one of the two stabilisers over the first, ensuring that the stabiliser faces the wall / door frame or other upright surface being used to measure against. The stabilisers ensure that the rod is as perpendicular as possible to enable accurate measurement.

4. Take the rod marked *. Again make sure that the measuring scale connects with the scale on the first rod and that the symbols match at each rod connection / junction. (If they do not, check that you have the correct rod).

5. Take the remaining two rods and put them together in order (matching the connecting symbols). Place the second stabiliser on the 3rd rod, but not at the level that the respondent height might be measured at.

6. Wipe the head plate and base plate with a Milton wipe and allow to dry for 30 secs.

3.3.3 Dismantling the stadiometer

Follow these rules:

1. Before you begin to dismantle the stadiometer you must remember to lower the head plate to its lowest position, so that the blade is lying flat against the base plate.

2. Remove one rod at a time.

3. Wipe the head plate and base plate with a Milton wipe and allow to dry for 30 secs. Before packing rods back into the base plate and head plate into the jiffy bag.

3.4 Procedure for adults

1. Ask the respondent to remove their shoes and loosen any hair accessory if possible (e.g. large hair grips; head bands, pony tail holders etc).

2. Assemble the stadiometer, near a wall if possible, and raise the headplate to allow sufficient room for the respondent to stand underneath it. Double check that you have assembled the stadiometer correctly.

3. Ask the respondent to stand with their feet flat on the centre of the base plate, feet together and heels against the back of the base plate as this helps people to ‘be at their highest’. The respondent’s back should be as straight as possible, preferably
against the rod but NOT leaning on it. They should have their arms hanging loosely by their sides. They should be facing forwards.

4. Move the respondent’s head so that the Frankfort Plane is in a horizontal position (i.e. parallel to the floor). The Frankfort Plane is an imaginary line passing through the external ear canal and across the top of the lower bone of the eye socket, immediately under the eye (see Figure 2). This position is important if an accurate reading is to be obtained. An additional check is to ensure that the measuring arm rests on the crown of the head, i.e. the top back half. To make sure that the Frankfort Plane is horizontal, you can use the Frankfort Plane Card to line up the bottom of the eye socket with the flap of skin on the ear. The Frankfort Plane is horizontal when the card is parallel to the stadiometer arm.

5. Instruct the respondent to keep their eyes focused on a point straight ahead, and without moving their head position, to breathe in deeply and stretch to their fullest height. Bring the head plate gently down onto the respondent’s head. If after stretching up the respondent’s head is no longer horizontal, repeat the procedure. It can be difficult to determine whether the stadiometer headplate is resting on the respondent’s head. If so, ask the respondent to tell you when s/he feels it touching their head.

6. Once the head plate is in place tell the respondent to relax, breathe out, and ask them to step forwards away from the stadiometer. If the measurement has been done correctly the respondent will be able to step off the stadiometer without ducking their head. Make sure that the head plate does not move when the respondent does this.

7. Look at the middle of the head plate cuff. There is a red or black arrowhead pointing to the measuring scale. Take the reading from this point and record the respondent’s height in centimetres and millimetres. If a measurement falls between two millimetres, it should be recorded to the nearest even millimetre (see section 2.4.).
8. If the respondent wishes, record their height onto the measurement record card.

9. Push the head plate high enough to avoid any member of the household hitting their head against it when getting ready to be measured. Once you have finished measuring everyone, lower the head plate to its lowest position, ready for dismantling.

3.5 Procedure for children (2-15)

The protocol for measuring children aged 2-15 differs slightly from that for adults. You must get the co-operation of an adult household member. You will need their assistance in order to carry out the protocol, as children are more likely to be co-operative themselves if another household member is involved in the measurement. If possible measure children last so that they can see what is going on before they are measured themselves.

Children’s bodies are much more elastic than those of adults. Unlike adults they will need your help in order to stretch to their fullest height. This is done by stretching them. This is essential in order to get an accurate measurement. It causes no pain and simply helps support the child while they stretch to their tallest height.

1. Explain to the parent and child what you will be doing, and ensure that both are happy with the procedure.

2. In addition to removing their shoes, children should remove their socks as well to ensure that they do not slip on the base of the stadiometer, and so that you can easily check their feet are flat on the base plate, not on tiptoes.

3. Assemble the stadiometer and raise the head plate to allow sufficient room for the child to stand underneath it.

4. Ask the child to stand with their feet flat on the centre of the base plate, feet together and heels against the rod. The child’s back should be as straight as possible, preferably against the rod, and their arms hanging loosely by their sides. They should be facing forwards.

5. Place the measuring arm just above the child’s head.

6. Move the child’s head so that the Frankfort Plane is in a horizontal position (see diagram). This position is as important when measuring children as it is when measuring adults if the measurements are to be accurate. To make sure that the Frankfort Plane is horizontal, you can use the Frankfort Plane Card to line up the
bottom of the eye socket with the flap of skin on the ear. The Frankfort Plane is horizontal when the card is parallel to the stadiometer arm. Explain what you are doing and tell the child that you want them to stand up straight and tall, but not to move their head or stand on their tiptoes. Ask them to look straight ahead.

7. Cup the child’s head in your hands, placing the heels of your palms either side of the chin, with your thumbs just in front of the ears, and your fingers going round towards the back of the neck. (See diagram below).

8. Ask the child to breathe in. Firmly but gently, apply upward pressure lifting the child’s head upwards towards the stadiometer head plate and thus stretching the child to their maximum height. Avoid jerky movements, perform the procedure smoothly and take care not to tilt the head at an angle: you must keep it in the Frankfort plane.

9. Ask the household member who is helping you to lower the head plate down gently onto the child’s head. Make sure that the plate touches the skull and that it is not pressing down too hard.

10. Still holding the child’s head, relieve traction and allow the child to stand relaxed and breathe out. If the measurement has been done properly the child should be able to step off the stadiometer without ducking their head. Make sure that the child does not knock the head plate as they step off.

11. Read the height value in metric units to the nearest millimetre (see section 2.4) and enter the reading into CAPI.

12. If the respondent wishes, record the reading on the child’s measurement record card.

13. Push the head plate high enough to avoid any member of the household hitting their head against it when getting ready to be measured.

| REMEMBER YOU ARE NOT TAKING HEIGHT AND WEIGHT MEASUREMENTS FOR CHILDREN UNDER 2 YEARS OLD |
PLEASE NOTE:
The child stretch on the Scottish Health Survey is different to that used on Child of the new century. Please use the SHeS stretch when measuring children for SHeS interviews.

PROTOCOL

- SHOES OFF
- CHILDREN – SOCKS OFF
- FEET TO THE BACK
- BACK STRAIGHT
- HANDS BY THE SIDE
- FRANKFORT PLANE
- LOOK AT A FIXED POINT
- CHILDREN – STRETCH & BREATHE IN
- ADULTS - BREATHE IN
- LOWER HEADPLATE
- BREATHE OUT
- STEP OFF
- READ MEASUREMENT
3.6 Additional points

- Some surveys require the respondent to be measured more than once; this will be stated in the project specific instructions. The protocol for taking the additional height measurements remains the same. Both measurements are to be recorded in CAPI and if they differ significantly CAPI will instruct you to take a third measurement.
- If the respondent cannot stand upright with their back against the stadiometer and have their heels against the rod (e.g. those with protruding bottoms) then give priority to standing upright.
- If the respondent has a hair style which stands well above the top of their head, or is wearing a religious head dress, with their permission, bring the headplate down until it touches the hair/head dress. You should never ask someone to remove a religious head dress. With some hairstyles you can compress the hair to touch the head. If you cannot lower the head plate to touch the head and think that this will lead to an unreliable measure, record this on CAPI. If it is a hairstyle that can be altered e.g. a bun, if possible ask the respondent to change/undo it.
- If the respondent is tall, it can be difficult to line up the Frankfort Plane in the way described. When you think that the plane is horizontal, take one step back to check from a short distance that this is the case.
- You may need to tip the stadiometer to read the height of tall respondents.
- If the respondent has long hair then they may need to tuck it behind their ear in order for the head to be positioned properly. Always ask the respondent to tuck their hair behind their ears.
4 WEIGHT MEASUREMENT

4.1 Introduction
Similar to the height measurement, the weight measurement is an indicator of and can predict the nutritional status and health of a population. When used in conjunction with the height measurement it can be used to derive the Body Mass Index, a statistical measure used to determine if an individual’s weight falls within a healthy range.

4.2 Exclusion criteria
Respondents are excluded from this measurement if they are:
- Pregnant
  If the woman wishes to be weighed, you can but do not enter the results into the computer.
- Too frail or unable to stand upright
  If you are concerned that being on the scales may cause them to be too unsteady on their feet then do not weigh them. Alternatively you can place the scales next to something that they can steady themselves on.
- Over 130kg (20 ½ stone) in weight as the maximum weight registering accurately on the scales is 130kg. If you think that the respondent exceeds this limit then code it appropriately in CAPI and follow the prompts. Do not attempt to weigh them.

4.3 Equipment
There are different sets of scales in circulation on NatCen projects. You will be provided with either:
- Tanita THD-305 scales
  The weight is displayed in a window on the scales. The scales are switched on by pressing the button on the bottom right hand corner of the scales. They are battery operated and require four 1.5v AA batteries, which should be sent with the scales. They may be packed separately or one of the batteries may be turned around, to prevent the batteries from going flat, as there is no on/off switch. Ensure that you have spare batteries, just in case you need them.
- Seca 877 scales
The weight is displayed in a window on the scales. The scales are switched on by briefly covering the solar cell (for no more than one second). The solar cell is on the right hand side of the weight display panel. NB You may experience difficulties switching the scales on if there is insufficient light for the solar cell. Make sure that the room is well lit. The scales have a fixed battery which cannot be removed.

Please check which scales you have been provided with and make sure that you are familiar with how they operate.

You will also need a pack of Milton antibacterial wipes.

4.3.1 Calibrating the scales

The scales will need to be sent to Brentwood at regular intervals to be recalibrated to ensure that they provide accurate measurements. On each set of scales there is a label with a date that they need to be recalibrated by, ensure that they have been sent to Brentwood by this date.
### 4.3.2 Technical faults

Please refer to Table 1 when experiencing technical difficulties with the scales.

**Table 1 Troubleshooting for the scales**

</table>

### 4.4 Procedure for adults

1. Weigh the respondent on a hard and even surface if possible. Carpets may affect measurements.

2. Ask the respondent to remove shoes, heavy outer garments such as jackets and cardigans, heavy jewellery, and to empty their pockets of all items.

3. Switch on the scales and wait for 888.8 (for the Tanita scales) or 1888 (for the Seca scales) to be momentarily displayed in the window. Do not attempt to weigh anyone at this point.

4. When the display reads 0.0, ask the respondent to stand with their feet together in the centre and their heels against the back edge of the scales. Their arms should be hanging loosely at their sides and their head should be facing forward. Having the respondent stand in this position means that the most accurate weight measurement can be obtained. Ensure that they keep looking ahead – it may be tempting for the respondent to look down at their weight reading. Ask them not to do this and assure them that you will tell them their weight afterwards if they want to know.
5. The scales will need to stabilise. The weight reading will flash on and off when it has stabilised. If the respondent moves excessively while the scales are stabilising you may get a false reading. If you think this is the case reweigh the respondent.

6. The scales are calibrated in kilograms and 100 gram units (0.1 kg). Record the reading in CAPI before the respondent steps off the scales.

7. If the respondent wishes, record the reading on their measurement record card.

8. The scales should switch off automatically a few seconds after the respondent steps off them.

9. Before packing the scales away ensure the footplate is wiped again to reduce potential cross infection between households.

4.5 Procedure for children

1. You must get the co-operation of an adult household member. This will help the child to relax and children, especially small children are much more likely to be cooperative themselves if an adult known to them is involved in the procedure.

2. Children who wear nappies should be dry. If the nappy is wet, please ask the parent to change it for a dry one and explain that the wetness of the nappy will affect the weight measurement.

3. Weigh the child, following the same procedure for adults. Encourage the child to ‘Be as still as a statue’ for an accurate reading. If you think that the results are inaccurate, code this in CAPI.

For very young children who are unable to stand unaided or small children who find this difficult follow the procedure below you will need to ask for the assistance of an adult as the following procedure requires you to measure the adult and then the adult holding the child:

1. Explain to the adult what you are going to do and the reasons why.

2. Code in CAPI the procedure used to measure the weight of the child.

3. Weigh the adult as normal following the protocol as set out above. Enter this weight into CAPI.

4. Weigh the adult and child together and enter this into CAPI. CAPI will calculate the difference between the two weights to get the child’s weight.

5. If the respondent wishes record this reading on their measurement record card.

6. Before packing the scales away ensure the footplate is wiped again to reduce potential cross infection between households.
5 WAIST CIRCUMFERENCE

5.1 Introduction
There has been increasing interest in the distribution of body fat as an important indicator of increased risk of cardiovascular disease. The waist circumference is a measure of the distribution of body fat. Waist circumference is probably a more important predictor of health risk than the body mass index (BMI), which is weight relative to height.

5.2 Exclusion criteria
Respondents are excluded from the waist circumference measurement if they:
- Are pregnant
- Are chair bound
- Have a colostomy / ileostomy (This is a surgical opening drawing the intestine or colon to the surface of the skin in the lower abdominal area. Bodily waste is collected in a pouch outside the body). Respondents may volunteer this information. Do not ask a respondent directly if they have a colostomy.

5.3 Equipment
You will need:
- A measuring tape calibrated in millimetres
- Milton wipes

5.4 Preparing the respondent
The respondent needs to be wearing light clothing. Never measure directly onto the skin. Explain to the respondent the importance of this measurement and that layers of clothing can substantially affect the reading. If possible the respondent needs to remove:
- All outer layers of clothing, such as jackets, heavy or baggy jumpers, cardigans and waistcoats
- Shoes with heels as this alters the natural position of the torso
- Tight garments intended to alter the shape of the body, such as corsets, lycra body suits and support tights/underwear (if the respondent is unable or unwilling to remove these then continue the measurement but record a note in CAPI)
- Belts (can be loosened if not removed)

Some respondents may be wearing religious or other symbols which they cannot remove and which may affect the measurement. Do not embarrass or offend the respondent by asking them to remove such items. Record in CAPI if the measurement is likely to be affected by this.
5.5 Procedure

1. Ensure that the respondent is standing erect in a relaxed manner and breathing normally. Weight should be evenly balanced on both feet and the feet should be about 25-30cm (1 foot) apart. The arms should be hanging loosely at their sides. This position will provide the most accurate and easy measurement of the waist.

2. Ask the respondent to point to his or her navel or tummy button.

3. Instruct the respondent to place the tape around their body, over their clothing, at the level of the navel. You should then click the popper in place and pull to tight the tape around the waist of the respondent overlying their navel (Section 6 WAIST AND HIP CIRCUMFERENCES - Use guidelines for ‘Easy Check Circumference’ tape measure). The tape should be snug but not tight. If the respondent is not able to pass the tape around his/her waist, you may have to hold onto one end of the tape measure at their navel, and walk around the respondent with the other end.

4. Check that the tape is not twisted and that it is horizontal all the way around the respondent. To do this you must look round the participant’s back from his/her left side to check that it is level. This will be easier if you are kneeling or sitting on a chair to the side of the respondent.

5. Ask the respondent to breathe normally and to look straight ahead.

6. Take the measurement at the end of a normal breath by holding the tape flat against the body.

7. Record the measurement in CAPI in centimetres, to one decimal place.

8. Repeat steps 1-7 to record a second measurement. If the second reading differs significantly from the first, CAPI will report an error message. At this point check that you have entered the results into CAPI correctly. Otherwise take a third measurement, following the procedure above. Enter this result into CAPI. The computer will know which two results to use.

9. If the respondent wishes, record the waist measurement on their measurement record card.

5.6 Additional points

- The tape should be tight enough so that it doesn’t slip but not tight enough to indent clothing.

- Some respondents will be wearing clothing where the waistband of the trousers/skirt sits on the waist. Do not ask them to move the clothing or take the measurement at a different position. Measure the waist circumference over the waistband and make a note of this in CAPI. If the waistband is not horizontal all the way around the body i.e. it may be lower at the front, always ensure that the tape is horizontal which may mean that it passes over the waist band in some places and not in others.
• We only want to record problems that will affect the measurement by more than would be expected when measuring over light clothing. As a rough guide only record a problem if you feel it affected the measurements by more than 0.5cm.

• Wipe the measurement tape with Milton wipes between households.
6 WAIST AND HIP CIRCUMFERENCES - USE GUIDELINES FOR ‘EASY CHECK CIRCUMFERENCE’ TAPE MEASURE

The ‘Easy Check Circumference’ tape measures are now being rolled out across all NatCen surveys requiring this measure. These tape measures come with a slider and press button closure.

To take a measurement with the new tape measure, wrap the tape measure around the respondent and click the press button in place at the back of the plastic slider. The red press button should click in the hole at the back of the slider as shown in the image below:

The plastic slider is gentle and can break if too much pressure is applied when clicking the press button in place. Make sure you press the button in place gently.

To tighten the tape around the respondent, pull gently at the other end of the tape. The tape is threaded through the slider and should slide easily to place. To read the measurement, look at the front of the plastic slider. There’s a red line to indicate where you should take the reading from as in the image below.
7 BLOOD PRESSURE

7.1 Introduction

Blood pressure is the exertion that the blood applies to the arterial walls as it is pumped through the circulatory system by the heart. Having a high blood pressure is an important risk factor for cardiovascular disease and stroke. The exact cause(s) of high blood pressure is not completely known; however some factors known to affect blood pressure are smoking, family history, physical fitness and diet. It is important that we examine blood pressure using a standard method to see the distribution of blood pressure measurements across the population. This is vital for monitoring change over time.

7.2 Exclusion criteria

Respondents are excluded from the blood pressure measure if they are:

- Pregnant (If a pregnant woman wishes to have her blood pressure measured, you may do so, but do not record the readings in CAPI)

7.3 Equipment

You will need:

- An Omron HEM 907 blood pressure monitor
- Child/ small adult cuff (17-22 cm)
- Standard adult cuff (22-32 cm)
- Large adult cuff (32-42 cm)
- An AC adapter
7.3.1 Using the Omron HEM 907

Figure 3 shows the monitor of the Omron

![Omron HEM 907 Monitor](image)

1. Switch the monitor on by pressing the ON/OFF button. Wait for the READY TO MEASURE symbol to light, indicating the monitor is ready to start the measurement (approximately 2 seconds).

2. Check that the MODE selector is set to AVG (average) and P-SET Volume (pressure setting) is set to auto.

3. Press the start button to begin the measurement. The cuff will start to inflate and take the first measurement. When the first measurement is complete, the LCD screen will show the systolic pressure, diastolic pressure and pulse rate. It will continue to do this at one minute intervals. The readings can be scrolled through at this point and should be recorded according to the project instructions, **before the monitor is turned off**.

4. Press the ON/OFF button to turn it off.
5. If at any stage while you are taking the measurement you need to stop the monitor, press STOP and start the procedure again.

### 7.3.2 Charging the battery

The Omron HEM 907 is equipped with a rechargeable battery, which is usable for approximately 300 measurements when fully charged.

When the battery symbol in the BATTERY display starts to flash there are 20-30 measurements left, you need to charge the battery soon. When a light battery symbol appears in the BATTERY display the battery needs to be put on charge immediately.

**To recharge the battery:**

Connect the monitor to the mains. A battery symbol will appear in the CHARGING display when the battery is charging. When ready to use the symbol will disappear. A dark battery symbol in the BATTERY display indicates that the battery is charged and the machine is useable. The battery can be charged in approximately 12 hours.

Connect the AC adapter to the DC jack of the main unit and the electric outlet.

**NOTE:** when the AC adapter is connected and the unit is turned off, the AC adapter charges the installed rechargeable battery. The Omron 907 is NOT designed to work off the mains adaptor, it should be run off the battery power pack. The mains adaptor should ONLY be used to charge the battery pack.

![Figure 4 Charging the battery](image)
### 7.3.3 Technical faults/error readings

Refer to table below when error readings appear on the LCD screen.

**Table 2 Troubleshooting for the Omron HEM 907**

<table>
<thead>
<tr>
<th>Error No.</th>
<th>Action</th>
</tr>
</thead>
</table>
| Er1, Er2  | • Check that the tube connecting the cuff to the monitor is properly inserted and is not bent  
• Check that the cuff is properly wrapped around the arm  
• Repeat the measure |
| Er3       | • Check that the tube connecting the cuff to the monitor is not bent  
• Repeat the measure |
| Er4       | • Ask the respondent to sit as still as possible  
• Repeat the measure  
• If it persists, it may be because the respondent has very high blood pressure  
• Reset the P-SET Volume to 260 and repeat the measure. |
| Er5, Er6  | • Check that the cuff is properly wrapped around the arm  
• Repeat the measure |
| Er7, Er8  | • Ask the respondent to sit as still as possible  
• Repeat the measure  
• If it persists, it may be because the respondent’s pulse is irregular, record that it wasn’t possible and explain that this sometimes happens. |
| Er9       | • Technical fault – Contact Brentwood and report that fault |

### 7.4 Preparing the respondent

Before the procedure CAPI will instruct you to ask the respondent if they have eaten, smoked, drunk alcohol or participated in vigorous exercise in the past 30 minutes. You should note their response in CAPI.

Select the right arm unless this is impossible. Ask the respondent to remove outer garment (e.g. jumper, cardigan, jacket) and expose their upper right arm by rolling up their sleeve. If the sleeve constricts the arm, restricting the circulation of blood, ask the respondent if they would mind taking their arm out of the sleeve for the measurement.

### 7.4.1 Selecting the correct cuff

Do not measure the upper arm circumference to determine which cuff size to use. Instead, choose the correct cuff size based on the acceptable range which is marked on the inside of the cuff. You will note that there is some overlap between the cuffs. If the respondent falls within this overlap range then use the standard cuff where possible.
7.5 Procedure

1. Ensure the respondent is sitting in a comfortable chair with a suitable support so that the right arm is resting at a level to bring the elbow to approximately heart level. They should be seated in a comfortable position with legs uncrossed and feet flat on the floor.

2. Place the monitor on a flat stable surface close to the respondent’s right side and at the level of the heart. Position the monitor so that it faces away from the respondent.

3. Turn the monitor on.

4. Using the right arm, unless this is impossible, ensure that the upper arm is either exposed or has a single layer of thin clothing only. If the left arm is used, record this in CAPI.

5. Wrap the correct sized cuff round the upper right arm and check that the index line falls within the range lines. Do not put the cuff on too tightly as bruising may occur on inflation. Ideally it should be possible to insert two fingers between the cuff and the arm.

6. Position the arrow on the lower end of the cuff (near the elbow) over the artery just medial to the biceps muscle. The lower edge should be about 1-2 cm above the elbow crease.

7. Explain to the respondent that you need them to sit quietly for five minutes and that during that time they cannot talk, eat, drink or smoke.

8. After five minutes explain that you are starting the measurement, also explain that the cuff will inflate three times and each time they will feel some pressure on their arm. Ask them to relax, be seated in the position detailed in step 1 and not to speak until the measurement has been completed, as it may affect their reading.

9. Press start on the Omron HEM 907 to start the measurement. When the first measurement is complete it will be displayed on the LCD screen.

10. The unit will produce readings at one minute intervals thereafter, you will then have three sets of readings. A further (4th) reading will appear which is the Average reading. All of these readings need to be recorded. To check the readings press the ‘Deflation’ button.

11. Record the measures into CAPI in the following order:
   a. Average – the reading that the Omron shows you once the measures are all complete
   b. 1st – To show this press the grey ‘deflation’ button once.
   c. 2nd – To show this press the grey ‘deflation’ button again.
   d. 3rd – To show this press the grey ‘deflation’ button again.

If you press the deflation button again it scrolls back round to the ‘Average’ reading. It is important that three readings are recorded as the first reading is usually higher, and thus less accurate, than the other two readings as the respondent may be feeling...
nervous. **NB – these must be recorded before the Omron turns itself off (after approx 3 mins) as the measures are not held in the memory then.**

12. Press ON/OFF on the Omron to switch the unit off and remove the cuff from the respondent’s arm.

13. If the respondent wishes, you should record details of their readings on the measurement record card.

14. Ensure that the cuffs stay clean. If the cuffs get soiled or you have concerns about potential or actual contamination dispose of the cuff and contact Brentwood for a replacement.

### 7.6 Respondent feedback

When answering queries about a respondent’s blood pressure it is very important to remember that it is NOT the purpose of the survey to provide respondents with medical advice, nor are you in a position to do so.

What you may say in each situation has been agreed with the Survey Doctor and CAPI will instruct you to read out the appropriate interpretations of the respondent’s results. It is very important that the agreed script in the CAPI is read word for word and that personal interpretation is never offered.

The respondent feedback protocol should be strictly followed. It is very important that as little anxiety as possible is caused, but at the same time we have a duty to advise people to see their GP if the measurements indicate that blood pressure is raised.

#### 7.6.1 Adult respondents

As stated previously we have a duty to inform people that they need to see their GP if their blood pressure is high. It is important that the instructions below are carefully read and guidelines always followed precisely.

The computer tells you which readings your advice should be based on. This will be based on the **lowest** systolic and **lowest** diastolic reading from the last two readings. This will usually, but not always, be from the same reading. For example, occasionally it may be the systolic from the second reading and the diastolic from the third reading. Furthermore if the lowest systolic reading falls in one category and the lowest diastolic reading falls in another category, the higher of the two categories will be used to trigger the advice to respondents. For example the lowest systolic reading is 138 (normal) and the lowest diastolic is 96 (mildly raised) then the advice given will be based on a mildly raised reading. If the first reading is higher than the other two it should be explained that the first reading can be high because people are nervous of having their pressure taken.

Definitions of raised blood pressure differ slightly. The Survey Doctor has recommended the blood pressure ratings given below based on the most recent guidelines from the British Hypertension Society. It is important that you adhere to these definitions, so that all respondents are treated in an identical manner. These are shown in table 3.
Table 3 Definition of blood pressure ratings

<table>
<thead>
<tr>
<th>Rating</th>
<th>Systolic</th>
<th>Diastolic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>&lt;140</td>
<td>&lt;90</td>
</tr>
<tr>
<td>Mildly raised</td>
<td>140 - 159</td>
<td>90 – 99</td>
</tr>
<tr>
<td>Raised</td>
<td>160 - 179</td>
<td>100 – 114</td>
</tr>
<tr>
<td>Considerably raised</td>
<td>180 or more</td>
<td>115 or more</td>
</tr>
</tbody>
</table>

Points to make to a respondent about their blood pressure (given on screen):

Normal:
'Your blood pressure is normal.'

Mildly raised:
'Your blood pressure is a bit high today.'
'Blood pressure can vary from day to day and throughout the day so that one high reading does not necessarily mean that you suffer from high blood pressure.'
'You are advised to visit your GP within 2 months to have a further blood pressure reading to see whether this is a one-off finding or not.'

Raised:
'Your blood pressure is a bit high today.'
'Blood pressure can vary from day to day and throughout the day so that one high reading does not necessarily mean that you suffer from high blood pressure.'
'You are advised to visit your GP or practice nurse within 2 weeks to have a further blood pressure reading to see whether this is a one-off finding or not.'

Considerably raised:
'Your blood pressure is high today.'
'Blood pressure can vary from day to day and throughout the day so that one high reading does not necessarily mean that you suffer from high blood pressure.'
'You are strongly advised to visit your GP or practice nurse within 5 days to have a further blood pressure reading to see whether this is a one-off finding or not.'

(For all of the above points, you can also advise the respondent to see their practice nurse, if this is who they would typically see in relation to their blood pressure.)
7.7 Action to be taken after the visit

If you need to contact the Survey Doctor, unless there is a hypertensive crisis, do not do this from the respondent’s home - you may cause unnecessary distress.

7.7.1 Adults

Table 4 summarises what action to take based on the readings you have obtained for a respondent. For this purpose you should only take into account the last two of the three readings you take, as the first reading is prone to error.

Table 4 Action due to blood pressure readings

<table>
<thead>
<tr>
<th>BLOOD PRESSURE</th>
<th>READING</th>
<th>Interviewer ACTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Systolic less than 180 mmHg and</td>
<td>No further action necessary</td>
</tr>
<tr>
<td>Mildly raised</td>
<td>Diastolic less than 115 mmHg</td>
<td></td>
</tr>
<tr>
<td>Raised</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Considerably</td>
<td>Systolic at or greater than 180 mmHg or</td>
<td>Contact the Survey Doctor at the earliest opportunity and she will inform the respondent.*</td>
</tr>
<tr>
<td>Raised</td>
<td>Diastolic at or greater than 115 mmHg</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the respondent has any symptoms of a hypertensive crisis** contact the survey doctor immediately or call an ambulance. The Survey Doctor must be informed as soon as possible.</td>
</tr>
</tbody>
</table>

* You must still contact the Survey Doctor even if respondents tell you that their GP knows about their raised BP.
** A hypertensive crisis is an extremely rare complication of high blood pressure. Its signs and symptoms include diastolic bp > 135 mmHg, headache, confusion, sleepiness, stupor, visual loss, seizures, coma, cardiac failure, oliguria, nausea & vomiting.

The Survey Doctor will look at all high or unusual readings when they reach the office. If the reading is high, then the Survey Doctor will contact the respondent directly. The Survey Doctor will also routinely check fast and slow pulse rates so no further action is necessary regarding these.

Contact details for your Survey Doctor can be found in the project instructions. The Survey Doctor is generally available from 8.00-22.00. Calls outside these hours are either unnecessary or an emergency, in which case, the survey doctor is unlikely to be in a position to do anything practical and you should be using your judgement whether to call an ambulance or seek other urgent advice.
8 SALIVA

8.1 Introduction

Saliva samples are taken from respondents for analysis to detect various chemical compounds (depending on the aims of the individual surveys) to provide information on peoples health and lifestyle. These compounds include:
- Cortisol, indicating an individual’s stress levels.
- Cotinine, a derivative of nicotine showing levels of exposure to tobacco smoke.

8.2 Exclusion criteria

Respondents are excluded from giving a saliva sample if they:
- Are pregnant
- Are HIV positive
- Have Hepatitis B or C

Do not ask for information regarding HIV and Hepatitis B or C, however if they volunteer it, record them as unable to give a sample and make a note.

8.3 Consent

There is a separate consent form for the saliva sample. This must be signed and dated by the respondent or by the parent or legal guardian in the case of children aged 15 years and below. Please make it clear to respondents that they will not receive results regarding their saliva sample (see section 2.5).

8.4 Preparing the respondent

Explain to the respondent what you will require them to do and the reasons behind why saliva samples are taken.

There are two different procedures that can be followed depending on the aims/requirements of the survey. Please refer to the project instructions for the preferred method.

8.5 Procedure One – dribbling into tube

8.5.1 Equipment

You will need:
- A plain 5ml tube
- A short wide bore straw
- Kitchen paper
- Gloves
8.5.2 Procedure

1. Remove the cap from the plain tube. Give the straw to the respondent. Explain that you want him/her to collect their saliva in their mouth and then let it dribble down the straw into the tube. The saliva does not need to go through the straw, the straw is intended to direct the saliva into the tube. Ensure that you are not getting sputum i.e. they are not clearing their chest to collect their saliva.

2. Allow the respondent 3 minutes to do this, collecting as much as you can in this time. The saliva will be frothy and will look greater in volume than it actually is, so do not give up too soon. You need at least 0.5cm on depth in the tube, not including froth.

3. If respondents find it difficult to use the straw they may dribble into the tube directly. This is acceptable, but encourage them to use the straw where possible.

4. If a respondent’s mouth is excessively dry and they cannot produce saliva allow them to have a drink of plain water. Wait for 5 minutes before collecting the sample to ensure that water is not retained when the sample is given.

5. Replace the cap on the tube and report any problems in CAPI. You should wear gloves at all times when you come in contact with a saliva sample.

6. Label and package as directed in the project specific instructions.

8.6 Procedure Two – using a salivette with cotton swab

8.6.1 Equipment

You will need:
- Salivettes
- Gloves

8.6.2 Procedure

1. Figure 5 is a picture of a salivette. ‘A’ shows the salivette correctly assembled and ‘B’ shows the four different parts that it consists of: the cap, absorbent swab, inner tube and outer tube.

2. To obtain the saliva sample, remove the inner tube from the outer tube. Remove the cap from the inner tube and instruct the respondent to take the absorbent swab from the inner tube, without touching it, by lifting the tube to their lips and letting the absorbent swab fall into their mouth. Further explain that they must leave it in their mouth until it is saturated with saliva.

3. Ask them to move it around in their mouth, gently biting on it, as this helps to ensure thorough wetting of the absorbent swab. It will vary from person to person, however 3 minutes will usually be ample.

4. If a respondent’s mouth is excessively dry and they cannot produce saliva allow them to have a drink of plain water. Wait for 5 minutes before collecting the sample to ensure that water is not retained when the sample is given.
5. When the absorbent swab is sufficiently wet, ask the respondent to remove it from their mouth and put the absorbent swab back into the inner tube, avoiding touching it if they can.

6. Wearing gloves, check that the swab is saturated. The tube should feel noticeably heavier than an unused one. If the swab rattles around in the tube then it is not wet enough and you need to give it back to the respondent to put back in their mouth.

7. Once you are satisfied that it is saturated replace the cap on the inner tube and put the inner tube back in the outer one (the inner tube has a hole in the bottom so will leak in the post if not placed in the outer tube). Record in CAPI any problems you may have had. You should wear gloves at all times when you come in contact with a saliva sample.

8. Label and package as directed in the project specific instructions.

Figure 5 ‘A’: an assembled salivette, ‘B’: the various components
9 SPOT URINE

9.1 Introduction
Urine, a waste product of human bodily functioning, can be analysed to provide information on various factors depending on the compound to be analysed (Table 5). The information that is obtained is highly accurate and cannot be taken from any other source. Please note that the compounds that are analysed are dependent on the individual survey.

Table 5 Compounds in urine analysis

<table>
<thead>
<tr>
<th>Chemical</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Potassium</td>
<td>Potassium is both an electrolyte and a mineral which works to keep a balance in bodily fluids and has an important role in nerve and muscle functioning. Potassium is found in fruit and vegetables and thus also indicates the fruit and vegetable intake of individuals.</td>
</tr>
<tr>
<td>Sodium (salt)</td>
<td>Sodium is both an electrolyte and a mineral which works to keep a balance in bodily fluids and has an important role in nerve and muscle functioning. Sodium is found in most foods and has been shown to contribute to high blood pressure which is a major risk factor in the development of cardiovascular disease.</td>
</tr>
<tr>
<td>Urea and Nitrogen</td>
<td>Urea and nitrogen are natural by-products of the human body. They are analysed to give an indication of kidney function. They also provide information on the amount of protein in an individual’s diet.</td>
</tr>
</tbody>
</table>

9.2 Exclusion criteria
Respondents are excluded from giving a urine sample if they:
- Are pregnant
- Are HIV positive
- Have Hepatitis B or C

Do not ask for information regarding HIV and Hepatitis B or C, however if they volunteer it, record them as unable to give a sample and make a note.

Women who have their period are not excluded from giving a urine sample. Respondents with a catheter are also not excluded. If the sample is taken from a catheter bag, this should be recorded in CAPI. It does not matter how long the urine has been in the collection bag.

9.3 Consent
There is a separate consent form for the urine sample. This must be signed and dated by the respondent or by the parent/legal guardian in the case of respondents aged 15 years and below. Please make it clear to respondents that they will not receive results regarding their urine sample.
9.4 Equipment

You will need:
- A 100ml Polypropylene disposable beaker
- A 10ml Sarstedt urine collection syringe and extension tube containing a small amount of a preservative
- An instruction leaflet on how to use and fill the Sarstedt syringe
- Coloured labels
- Gloves
- A polythene bag to store the equipment in and can be used to discard the used equipment once the sample has been taken (optional).

9.5 Preparing the respondent

Explain to the respondent that you need a urine sample and why it is important. Explain the equipment to them and show them how to use the Sarstedt syringe. A demonstration consisting of a syringe and a beaker filled with water can be used for this purpose. The instruction leaflet, similar to Section 9.5.1, can be left with the respondent for easy reference while performing the urine collection in private, if required. Explain the procedure below to the respondent. Tell them that you need them to follow the procedure as carefully as possible.
9.5.1 Urine sample syringe instructions

1. Collect your sample in the disposable pot.
2. Remove the small push cap.
3. Push the extension tube on the syringe nozzle.
4. Put the end of the tube into the urine in the beaker and pull back the syringe to fill it.
5. Remove the extension tube.
6. Replace the cap.
7. Pull the syringe plunger until it clicks and break off the stalk.

NB: Person in pictures should be wearing gloves!
9.6 Procedure

1. Respondents are to wash their hands with soap and water prior to voiding to avoid contaminating the sample with substances which may be on their hands. It is important that the inside of the urine collection beaker is not touched or allowed to come into contact with any part of the respondent’s body, clothing or any external surfaces.

2. Ask the respondent to collect a mid flow sample of their urine in the disposable collection beaker.

3. Immediately after voiding they need to collect a sample of the urine by using the syringe as you have demonstrated to them and by following the instructions on the card. The collection of the urine sample needs to happen immediately after voiding to minimise specimen exposure to air.

4. Ask the respondent to wash the outside of the filled and sealed syringe and dry it using toilet roll, once the sample collection is complete.

5. If the respondent is unable to fill the syringe him/herself, or would rather not do so, you can do this for them. Emphasise that the sample needs to be taken from the sample straight away in order to minimise specimen exposure to air, so as soon as they have finished they need to bring it to you or leave it in the bathroom and notify you that the sample is ready. Please ensure that you are wearing gloves before attempting to fill the syringe for this respondent, you should wear gloves at all times when you come in contact with a urine sample.

6. Make sure that the plastic cap is securely sealed and the syringe plunger stalk snapped.

7. Label and package the sample according to the project specific instructions.

8. To dispose of the sample, pour the remaining urine in the toilet and throw the beaker and used equipment in the rubbish bin (if the respondent prefers, this can be put in a polythene bag first and then thrown in the rubbish bin).
10 CONTACTS

Should you have any questions regarding the protocols then please do not hesitate to contact your project manager. You can also contact the Survey Doctor, whose details can be found in the project instructions.

Should you have any questions regarding the project on which you are working then please contact the relevant operations team in Brentwood or the research team in Edinburgh. These details are also found in the project instructions.

11 USEFUL NATCEN REFERENCE GUIDES

1. **CMS User Guide**
   For all queries on using the CAPI menu system.

2. **Operations Standards Handbook**
   A guide for interviewers, nurses and researchers

3. **Project Instructions**
Appendix C
Health Board areas
Appendix D
Glossary
This glossary explains terms used in the report, other than those fully described in particular chapters.

**Age Standardisation**

Age standardisation has been used in order to enable groups to be compared after adjusting for the effects of any differences in their age distributions.

When different sub-groups are compared in respect of a variable on which age has an important influence, any differences in age distributions between these sub-groups are likely to affect the observed differences in the proportions of interest.

Age standardisation was carried out, using the direct standardisation method. The standard population to which the age distribution of sub-groups was adjusted was the mid-2013 population estimates for Scotland. All age standardisation has been undertaken separately within each sex.

The age-standardised proportion \( p' \) was calculated as follows, where \( p_i \) is the age specific proportion in age group \( i \) and \( N_i \) is the standard population size in age group \( i \):

\[
p' = \frac{\sum_i N_i p_i}{\sum_i N_i}
\]

Therefore \( p' \) can be viewed as a weighted mean of \( p_i \) using the weights \( N_i \). Age standardisation was carried out using the age groups: 16-24, 25-34, 35-44, 45-54, 55-64, 65-74 and 75 and over. The variance of the standardised proportion can be estimated by:

\[
var(p') = \frac{\sum_i (N_i^2 p_i q_i / n_i)}{(\sum_i N_i)^2}
\]

where \( q_i = 1 - p_i \).

**Anthropometric measurement**

See **Body mass index (BMI)**, **Waist circumference**

**Arithmetic mean**

See **Mean**

**AUDIT**

The Alcohol Use Disorders Identification Test (AUDIT) is a tool developed by the World Health Organisation used to measure harmful alcohol consumption or dependence. In 2012 it was used on SHeS, replacing the CAGE questionnaire, which was also used to identify prevalence of problem drinking. AUDIT
consists of 10 questions – questions 1-3 are indicators of consumption, questions 4-6 are indicators of alcohol dependency and questions 7-10 are indicators of harmful consumption. A score of 8 or more are taken to be indicative of an alcohol use disorder. Scores 8 to 15 suggest “hazardous” drinking behaviour and scores of 16 to 19 indicate “harmful” behaviour, although neither of these groups tend to be considered in isolation. Due to the (potentially) sensitive nature of the questions, this questionnaire was administered in self-completion format. All participants who drank alcohol more than very occasionally were asked to complete the questions.

**Bases**

See **Unweighted bases, Weighted bases**

**Blood pressure**

Systolic (SBP) and diastolic (DBP) blood pressure were measured using a standard method (see Volume 2, Appendix B for measurement protocol). In adults, high blood pressure is defined as SBP ≥140 mmHg or DBP ≥90 mmHg or on antihypertensive drugs.

**Body mass index**

Weight in kg divided by the square of height in metres. Adults (aged 16 and over) can be classified into the following BMI groups:

<table>
<thead>
<tr>
<th>BMI (kg/m²)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 18.5</td>
<td>Underweight</td>
</tr>
<tr>
<td>18.5 to less than 25</td>
<td>Normal</td>
</tr>
<tr>
<td>25 to less than 30</td>
<td>Overweight</td>
</tr>
<tr>
<td>30 to less than 40</td>
<td>Obese</td>
</tr>
<tr>
<td>40 and above</td>
<td>Morbidly obese</td>
</tr>
</tbody>
</table>

Although the BMI calculation method is the same, there are no fixed BMI cut-off points defining overweight and obesity in children. Instead, overweight and obesity are defined using several other methods including age and sex specific BMI cut-off points or BMI percentiles cut-offs based on reference populations. Children can be classified into the following groups:

<table>
<thead>
<tr>
<th>Percentile cut-off</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>At or below 2nd percentile</td>
<td>At risk of underweight</td>
</tr>
<tr>
<td>Above 2nd percentile and below 85th percentile</td>
<td>Healthy weight</td>
</tr>
<tr>

**CAGE**

The CAGE questionnaire was included in SHeS between 1995 and 2011 and was replaced by the AUDIT questionnaire in 2012. It was asked of participants aged 16 and over who drank alcohol more than occasionally. Three questions relate to
physical dependency on alcohol and the other three relate to feeling that they ought to cut down on drinking, feeling guilty about drinking and annoyance of other people’s impression of their own drinking. Agreement with two (or more) of the six CAGE items is indicative of problem drinking. This questionnaire was administered in self-completion format due to the sensitive nature of the questions.

**Cardiovascular Disease**

Participants were classified as having cardiovascular disease (CVD) if they reported ever having any of the following conditions diagnosed by a doctor: angina, heart attack, stroke, heart murmur, irregular heart rhythm, ‘other heart trouble’. For the purpose of this report, participants were classified as having a particular condition only if they reported that the diagnosis was confirmed by a doctor. No attempt was made to assess these self-reported diagnoses objectively. There is therefore the possibility that some misclassification may have occurred, because some participants may not have remembered (or not remembered correctly) the diagnosis made by their doctor.

**Chronic Obstructive Pulmonary Disease (COPD)**

COPD is defined by the World Health Organisation (WHO) as ‘a pulmonary disease characterised by chronic obstruction lung airflow that interferes with normal breathing and is not fully reversible.’ It is associated with symptoms and clinical signs that in the past have been called ‘chronic bronchitis’ and ‘emphysema,’ including regular cough (at least three consecutive months of the year) and production of phlegm.

**Cotinine**

Cotinine is a metabolite of nicotine. It is one of several biological markers that are indicators of smoking. In this survey, it was measured in saliva. It has a half-life in the body of between 16 and 20 hours, which means that it will detect regular smoking (or other tobacco use such as chewing) but may not detect occasional use if the last occasion was several days ago. Anyone with a salivary cotinine level of 12 nanograms per millilitre or more was judged highly likely to be a tobacco user. Saliva samples were collected as part of the biological module.

**Creatinine**

This is excreted in urine and unlike sodium and potassium is relatively stable over time. Therefore in the analysis of urinary salt, the ratio of sodium to creatinine and of potassium to creatinine are analysed as proxy measures for dietary sodium and potassium. See also Urine, Sodium, Potassium.

**Diastolic blood**

When measuring blood pressure the diastolic arterial pressure is the lowest pressure at the resting phase of the cardiac cycle. See also Blood pressure, Systolic blood pressure.
DSM-IV

The DSM-IV screening instrument was developed for the British Gambling Prevalence Survey (BGPS) series is based on criteria from the fourth edition of the Diagnostic and Statistical Manual of Mental Disorders of the American Psychiatric Association (DSM-IV). This contains ten diagnostic criteria ranging from chasing losses to committing a crime to fund gambling. The DSM-IV criteria constitute a tool created for diagnosis of pathological gambling by clinicians and was not intended for use as a screening instrument among the general population. As such, there is no ‘gold standard’ questionnaire version of the DSM-IV. The screen used within the BGPS series and on SHeS was first developed in 1999 and was subject to a rigorous development and testing process, including cognitive testing and piloting. Each DSM-IV item is assessed on a four point scale, ranging from ‘never’ to ‘very often’. Responses to each item can either be dichotomised to show whether a person meets the criteria or not, or allocated a score and a total score produced. Previous surveys in the BGPS series have used the dichotomous scoring method and it is this method that is presented in this report. A total score between zero and ten is possible.

Among clinicians, a diagnosis of pathological gambling is made if a person meets five out of the ten criteria. Many surveys including the BGPS, when adapting the DSM-IV criteria into a screening instrument for use within a general population survey have included a further category of ‘problem gambler’ for those who meet at least three of the DSM-IV criteria. This cut-point has been found to give good discrimination between criterion groups and has provided the closest match to prevalence estimated by alternative screens used in the BGPS series (the SOGs in 1999 and PGSI in 2007).

Electronic cigarettes or e-cigarettes are battery-powered handheld devices which heat a liquid that delivers a vapour. The vapour is then inhaled by the user, which is known as ‘vaping’. E-cigarettes typically consist of a battery, an atomiser and a cartridge containing the liquid. Earlier models, often referred to as ‘cigalikes’, were designed to closely resemble cigarettes but there is now a wide variety of product types on the market. The liquid is usually flavoured and may not contain nicotine, although in most cases e-cigarettes are used with nicotine. Unlike conventional or traditional cigarettes, they do not contain tobacco and do not involve combustion (i.e. they are not lit).

Equivalised Household income

Making precise estimates of household income, as is done for example in the Family Resources Survey, requires far more interview time than was available in the Health Survey. Household income was thus established by means of a card (see Volume 2, Appendix A) on which banded incomes were
presented. Information was obtained from the household reference person (HRP) or their partner. Initially they were asked to state their own (HRP and partner) aggregate gross income, and were then asked to estimate the total household income including that of any other persons in the household. Household income can be used as an analysis variable, but there has been increasing interest recently in using measures of equivalised income that adjust income to take account of the number of persons in the household. Methods of doing this vary in detail: the starting point is usually an exact estimate of net income, rather than the banded estimate of gross income obtained in the Health Survey. The method used in the present report was as follows. It utilises the widely used McClements scoring system, described below.

1. A score was allocated to each household member, and these were added together to produce an overall household McClements score. Household members were given scores as follows.

<table>
<thead>
<tr>
<th>Role</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>First adult (HRP)</td>
<td>0.61</td>
</tr>
<tr>
<td>Spouse/partner of HRP</td>

<tr>
<td>Dependant aged 16+</td>
<td>0.36</td>
</tr>
</tbody>
</table>

2. The equivalised income was derived as the annual household income divided by the McClements score.

3. This equivalised annual household income was attributed to all members of the household, including children.

4. Households were ranked by equivalised income, and quintiles q1 - q5 were identified. Because income was obtained in banded form, there were clumps of households with the same income spanning the quintiles. It was decided not to split clumps but to define the quintiles as ‘households with equivalised income up to q1’, ‘over q1 up to q2’ etc.

5. All individuals in each household were allocated to the equivalised household income quintile to which their household had been allocated. Insofar as the mean number of persons per household may vary between tertiles, the numbers in the quintiles will be unequal. Inequalities in numbers are also introduced by the clumping referred to
above, and by the fact that in any sub-group analysed the proportionate distribution across quintiles will differ from that of the total sample.

**Frankfort plane**
The Frankfort Plane is an imaginary line passing through the external ear canal and across the top of the lower bone of the eye socket, immediately under the eye. Informants’ heads are positioned with the Frankfort Plane in a horizontal position when height is measured using a stadiometer as a means of ensuring that, as far as possible, the measurements taken are standardised.

**Geometric mean**
The geometric mean is a measure of central tendency. It is sometimes preferable to the arithmetic mean, since it takes account of positive skewness in a distribution. An arithmetic mean is calculated by summing the values for all cases and dividing by the number of cases in the set. The geometric mean is instead calculated by multiplying the values for all cases and taking the \( n \)th root, where \( n \) is the number of cases in the set. For example, a dataset with two cases would use the square root, for three cases the cube root would be used, and so on. The geometric mean of 2 and 10 is 4.5 (\( 2 \times 10 = 20 \), \( \sqrt[2]{20} = 4.5 \)). Geometric means can only be calculated for positive numbers so zero values need to be handled before geometric means are calculated. See also mean.

**GHQ12**
The General Health Questionnaire (GHQ12) is a scale designed to detect possible psychiatric morbidity in the general population. It was administered to informants aged 13 and above. The questionnaire contains 12 questions about the informant’s general level of happiness, depression, anxiety and sleep disturbance over the past four weeks. Responses to these items are scored, with one point given each time a particular feeling or type of behaviour was reported to have been experienced ‘more than usual’ or ‘much more than usual’ over the past few weeks. These scores are combined to create an overall score of between zero and twelve. A score of four or more (referred to as a ‘high’ GHQ12 score) has been used in this report to indicate the presence of a possible psychiatric disorder.

**High blood pressure**
See Blood pressure

**Household**
A household was defined as one person or a group of people who have the accommodation as their only or main residence
and who either share at least one meal a day or share the living accommodation.

**Household Reference Person**
The household reference person (HRP) is defined as the householder (a person in whose name the property is owned or rented) with the highest income. If there is more than one householder and they have equal income, then the household reference person is the oldest.

**Income**
See *Equivalised household income*

**Ischaemic heart disease**
Participants were classified as having ischaemic heart disease (IHD) if they reported ever having angina or a heart attack diagnosed by a doctor.

**Latent Class Analysis**
Latent class analysis is a statistical approach which categorises people into different groups or ‘latent classes’ based on responses to a series of questions. LCA operates by identifying the number of classes or groups that best fit the data and generating probabilities membership of each group for every eligible participant. Once this is done, a participant is assigned to the class for which they have the highest probability of membership.

**Logistic regression**
Logistic regression was used to investigate the effect of two or more independent or predictor variables on a two-category (binary) outcome variable. The independent variables can be continuous or categorical (grouped) variables. The parameter estimates from a logistic regression model for each independent variable give an estimate of the effect of that variable on the outcome variable, adjusted for all other independent variables in the model.

Logistic regression models the log ‘odds’ of a binary outcome variable. The ‘odds’ of an outcome is the ratio of the probability of it occurring to the probability of it not occurring. The parameter estimates obtained from a logistic regression model have been presented as odds ratios for ease of interpretation.

For *continuous* independent variables, the odds ratio gives the change in the odds of the outcome occurring for a one unit change in the value of the predictor variable.

For *categorical* independent variables one category of the categorical variable has been selected as a baseline or reference category, with all other categories compared to it. Therefore there is no parameter estimate for the reference category and odds ratios for all other categories are the ratio of the odds of the outcome occurring between each category and the reference category, adjusted for all other variables in the model.
The statistical significance of independent variables in models was assessed by the likelihood ratio test and its associated p value. 95% confidence intervals were also calculated for the odds ratios. These can be interpreted as meaning that there is a 95% chance that the given interval for the sample will contain the true population parameter of interest. In logistic regression a 95% confidence interval which does not include 1.0 indicates the given parameter estimate is statistically significant.

**Long-term conditions & limiting long-term conditions**

Long-term conditions were defined as a physical or mental health condition or illness lasting, or expected to last 12 months or more. The wording of this question changed in 2012 and is now aligned with the harmonised questions for all large Scottish Government surveys. Between 2008 and 2011 participants were asked whether they had a long-standing physical or mental condition or disability that has troubled them for at least 12 months, or is likely to affect them for at least 12 months. Note that prior to 2008 these were described as long-standing illnesses. Long-term conditions were coded into categories defined in the International Classification of Diseases (ICD), but it should be noted that the ICD is used mostly to classify conditions according to the cause, whereas SHeS classifies according to the reported symptoms. A long-term condition was defined as limiting if the respondent reported that it limited their activities in any way.

**Mean**

Most means in this report are *Arithmetic means* (the sum of the values for cases divided by the number of cases). See also *Geometric means* which are used in the analysis of saliva samples.

**Median**

The value of a distribution which divides it into two equal parts such that half the cases have values below the median and half the cases have values above the median.

**Morbid obesity**

See *Body mass index*.

**NHS Health Board**

The National Health Service (NHS) in Scotland is divided up into 14 geographically-based local NHS Boards and a number of National Special Health Boards. Health Boards in this report refers to the 14 local NHS Boards. (See Volume 2: Appendix C)

**NS-SEC**

The National Statistics Socio-economic Classification (NS-SEC) is a social classification system that attempts to classify groups on the basis of employment relations, based on characteristics such as career prospects, autonomy, mode of payment and period of notice. There are fourteen operational categories representing different groups of occupations (for example higher
and lower managerial, higher and lower professional) and a further three ‘residual’ categories for full-time students, occupations that cannot be classified due to lack of information or other reasons. The operational categories may be collapsed to form a nine, eight, five or three category system. This report mostly uses the five category system in which participants are classified as managerial and professional, intermediate, small employers and own account workers, lower supervisory and technical, and semi-routine and routine occupations. In some instances where there were insufficient numbers to use the five category classification, the three category system was used instead. In analyses presented in this report it is the NS-SEC of the household reference person which is used. NS-SEC was introduced in 2001 and replaced Registrar General’s Social Class (which had been used in the 1995 and 1998 surveys) as the main measure of socio-economic status.

Obesity See Body mass index

Odds ratio See Logistic regression

Overweight See Body mass index

Percentile The value of a distribution which partitions the cases into groups of a specified size. For example, the 20th percentile is the value of the distribution where 20 percent of the cases have values below the 20th percentile and 80 percent have values above it. The 50th percentile is the median.

p value A p value is the probability of the observed result occurring due to chance alone. A p value of less than 5% is conventionally taken to indicate a statistically significant result (p<0.05). It should be noted that the p value is dependent on the sample size, so that with large samples differences or associations which are very small may still be statistically significant. Results should therefore be assessed on the magnitude of the differences or associations as well as on the p value itself. The p values given in this report take into account the clustered sampling design of the survey.

Problem Gambling Severity Index (PGSI) The PGSI, developed by Ferris and Wynne, was specifically designed for use among the general population rather than within a clinical context. It was developed, tested and validated within a general population survey of over 3,000 Canadian residents. The index consists of nine items ranging from chasing losses to gambling causing health problems to feeling guilty about gambling. Each item is assessed on a four-point scale: never, sometimes, most of the time, almost always. Responses to each item are given the following scores: never = zero; sometimes = one; most of the time = two; almost always =
three. When scores to each item are summed, a total score ranging from zero to 27 is possible. A PGSI score of eight or more represents a problem gambler. This is the threshold recommended by the developers of the PGSI and the threshold used in this report. The PGSI was also developed to give further information on sub-threshold problem gamblers. PGSI scores between three and seven are indicative of 'moderate risk' gambling and a score of one or two is indicative of 'low risk' gambling.

Potassium

The intake of potassium (K) can be estimated by measuring urinary excretion. This is collected in the biological module using a spot urine sample. See also Urine, Sodium, Creatinine. There is an inverse association between potassium intake and blood pressure.

Quintile

Quintiles are percentiles which divide a distribution into fifths, i.e., the 20th, 40th, 60th and 80th percentiles.

Scottish Index of Multiple Deprivation

The Scottish Index of Multiple Deprivation (SIMD) is the Scottish Government’s official measure of area based multiple deprivation. It is based on 37 indicators across 7 individual domains of current income, employment, housing, health, education, skills and training and geographic access to services and telecommunications. SIMD is calculated at data zone level, enabling small pockets of deprivation to be identified. The data zones are ranked from most deprived (1) to least deprived (6505) on the overall SIMD index. The result is a comprehensive picture of relative area deprivation across Scotland.

This report uses the SIMD 2012.
http://www.scotland.gov.uk/Topics/Statistics/SIMD

Sodium

The intake of sodium (Na) can be estimated by measuring urinary excretion. This was collected in the biological module using a spot urine sample. There is an association between sodium intake and blood pressure. See also Urine, Potassium, Creatinine.

SDQ

The Strengths and Difficulties Questionnaire (SDQ) is designed to detect behavioural, emotional and relationship difficulties in children aged 4-16. The questionnaire is based on 25 items: 10 strengths, 14 difficulties and one neutral item. The 25 items are divided into 5 scales of 5 items each: hyperactivity, emotional symptoms, conduct problems, peer problems and prosocial behaviour. Each SDQ item has three possible answers which are assigned a value 0,1 or 2. The score for each scale is generated by adding up the scores on the 5 items within that scale, producing scale scores ranging from 0 to 10. A ‘Total Difficulties’ score is derived from the sum of scores from each of the scales.
except the Prosocial Behaviour scale, producing a total score from 0 to 40. The SDQ was used for children aged 4-12 in the 2008, 2009, 2010 and 2011 surveys.

The SDQ correlates highly with the Rutter questionnaire and the Child Behaviour Checklist, both of which are long established behavioural screening questionnaires for children that have been proved valid and reliable in many contexts and correlate highly with one another. The SDQ is shorter than these screening instruments and is the first to include a scale focusing on positive behaviour: the Prosocial Behaviour Scale.

**Standard deviation**
The standard deviation is a measure of the extent to which the values within a set of data are dispersed from, or close to, the mean value. In a normally distributed set of data 68% of the cases will lie within one standard deviation of the mean, 95% within two standard deviations and 99% will be within 3 standard deviations. For example, for a mean value of 50 with a standard deviation of 5, 95% of values will lie within the range 40-60.

**Standard error**
The standard error is a variance estimate that measures the amount of uncertainty (as a result of sampling error) associated with a survey statistic. All data presented in this report in the form of means are presented with their associated standard errors (with the exception of the WEMWBS scores which are also presented with their standard deviations). Confidence intervals are calculated from the standard error; therefore the larger the standard error, the wider the confidence interval will be.

**Standardisation**
In this report, standardisation refers to standardisation (or 'adjustment') by age (see Age standardisation).

**Systolic blood**
When measuring blood pressure, the systolic arterial pressure is pressure defined as the peak pressure in the arteries, which occurs near the beginning of the cardiac cycle. See also Blood pressure, Diastolic blood pressure.

**Unit of alcohol**
Alcohol consumption is reported in terms of units of alcohol. A unit of alcohol is 8 gms or 10ml of ethanol (pure alcohol). See Chapter 3 of volume 1 of this Report for a full explanation of how reported volumes of different alcoholic drinks were converted into units. The method for doing this has undergone significant change since the report of the 2003 SHeS was published, these are also detailed in Chapter 3.
Urine
A spot urine sample was collected from participants in the biological module. This was used for the analysis of dietary Sodium, Potassium and Creatinine. Epidemiological, clinical and animal-experimental evidence shows a direct relationship between dietary electrolyte consumption and blood pressure (BP).

Unweighted bases
The unweighted bases presented in the report tables provide the number of individuals upon which the data in the table is based. This is the number of people that were interviewed as part of the SHeS and provided a valid answer to the particular question or set of questions. The unweighted bases show the number of people interviewed in various subgroups including gender, age and SIMD.

Waist Circumference
Waist circumference is a measure of deposition of abdominal fat. It was measured during the biological module. A raised waist circumference has been defined as more than 102cm in men and more than 88cm in women.

Weighted bases
See also Unweighted bases. The weighted bases are adjusted versions of the unweighted bases which involves calculating a weight for each individual so that their representation in the sample reflects their representation in the general population of Scotland living in private households. Categories within the table can be combined by using the weighted bases to calculate weighted averages of the relevant categories.

WEMWBS
The Warwick-Edinburgh Mental Well-being Scale (WEMWBS) was developed by researchers at the Universities of Warwick and Edinburgh, with funding provided by NHS Health Scotland, to enable the measurement of mental well-being of adults in the UK. It was adapted from a 40 item scale originally developed in New Zealand, the Affectometer 2. The WEMWBS scale comprises 14 positively worded statements with a five item scale ranging from ‘1 - None of the time’ to ‘5 - All of the time’. The lowest score possible is therefore 14 and the highest is 70. The 14 items are designed to assess positive affect (optimism, cheerfulness, relaxation); and satisfying interpersonal relationships and positive functioning (energy, clear thinking, self-acceptance, personal development, mastery and autonomy).

References:
The briefing paper on the development of WEMWBS is available online from:<http://www.wellscotland.info/guidance/How-to-measure>
The United Kingdom Statistics Authority has designated the Scottish Health Survey as National Statistics, in accordance with the Statistics and Registration Service Act 2007 and signifying compliance with the Code of Practice for Official Statistics.

Designation can be interpreted to mean that the statistics: meet identified user needs; are produced, managed and disseminated to high standards; and are explained well.
