## **1. Introduction**

Scottish Sea Fisheries Statistics is a National Statistics publication produced by the Marine Analytical Unit (MAU) in Marine Scotland to provide detailed information on the Scottish fishing industry. The statistics presented in this publication include the tonnage and value of all landings of sea fish and shellfish by Scottish vessels, all landings into Scotland, rest of UK and abroad; and the size and structure of the Scottish fishing fleet and employment on Scottish vessels. Data on landings by other UK vessels and landings into the UK is also provided.

All landings tonnages are given in terms of live weight equivalent, overall financial values are provided nominal (not adjusted for inflation) and year on year percentage changes in financial values are calculated at 2017 prices (to adjust for inflation). All tables presented here and in previous publications are available for download from the Scottish Sea Fisheries Statistics website (see page 37 for the link).

## **2. Overview Statistics**

### **2.1. Landings by Scottish vessels**

In 2017, Scottish vessels landed 466 thousand tonnes of sea fish and shellfish, with a gross value of £560 million. Compared to 2016 there was a small change in the real value of landings (one per cent decrease) and a three per cent increase in the tonnage landed.

The decrease in value was driven mostly by pelagic species – herring and mackerel, as demersal and shellfish species both increased in value. Mackerel remains the most valuable species at £162 million, accounting for 29 per cent of the total value of Scottish landings. In 2017 the real value of mackerel fell six per cent and tonnage decreased by five per cent.

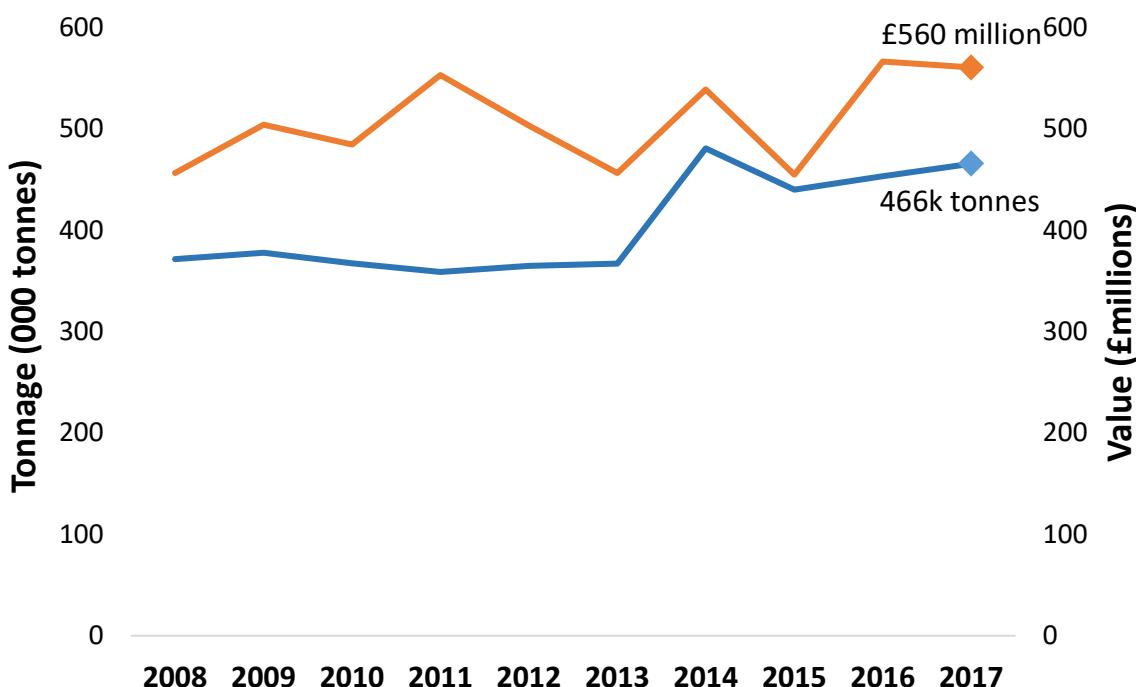

The top three demersal species by value are haddock, monkfish (anglerfish) and cod. The real terms value of haddock was up 11 per cent to £42 million, monkfish three per cent to £36 million and cod 23 per cent to £34 million since 2016. Together these three species account for 20 per cent of the total value of Scottish landings.

Shellfish landings increased in real terms by six per cent to £180 million and the tonnage of shellfish landed decreased by two per cent from 2016. *Nephrops* are the most valuable shellfish stock and second most valuable stock overall, representing 13 per cent of the total value of Scottish landings in 2017 and 42 per cent of the value of shellfish landings. Scallops are the second most valuable shellfish species landed by Scottish fleet representing seven per cent of the total value and 22 per cent of the shellfish value.

Table 1. Change in total tonnage and value of landings by Scottish vessels between 2017 vs. 2016<sup>1</sup>

	Tonnage 2017	Change from 2016	Value (£000) 2017	Change from 2016
<b>Demersal</b>	101,864	7%	183,841	7%
Haddock	28,116	<1%	42,419	11%
Monkfish	13,040	3%	36,336	3%
Cod	14,802	3%	34,295	23%
<b>Pelagic</b>	301,352	2%	197,088	-13%
Mackerel	179,955	-5%	161,890	-6%
Herring	56,423	-14%	23,776	-45%
<b>Shellfish</b>	62,493	-2%	179,531	6%
Nephrops	21,764	3%	75,198	-4%
Scallops	15,772	3%	39,595	5%
<b>TOTAL</b>	<b>465,710</b>	<b>3%</b>	<b>560,460</b>	<b>-1%</b>

Chart 1. Total tonnage and value (adjusted to 2017 prices) of all landings by Scottish vessels, 2008-2017

As shown in Chart 1, the general trend in the tonnage and value of landings over the past ten years is positive; tonnage has increased by 94,000 tonnes (25 per cent) and value in real terms has increased by £104 million (23 per cent) since 2008.

<sup>1</sup> Overall values are given in nominal terms in 2017, but percentage changes reflect real changes after adjusting for inflation.

## 2.1. The Scottish fishing fleet

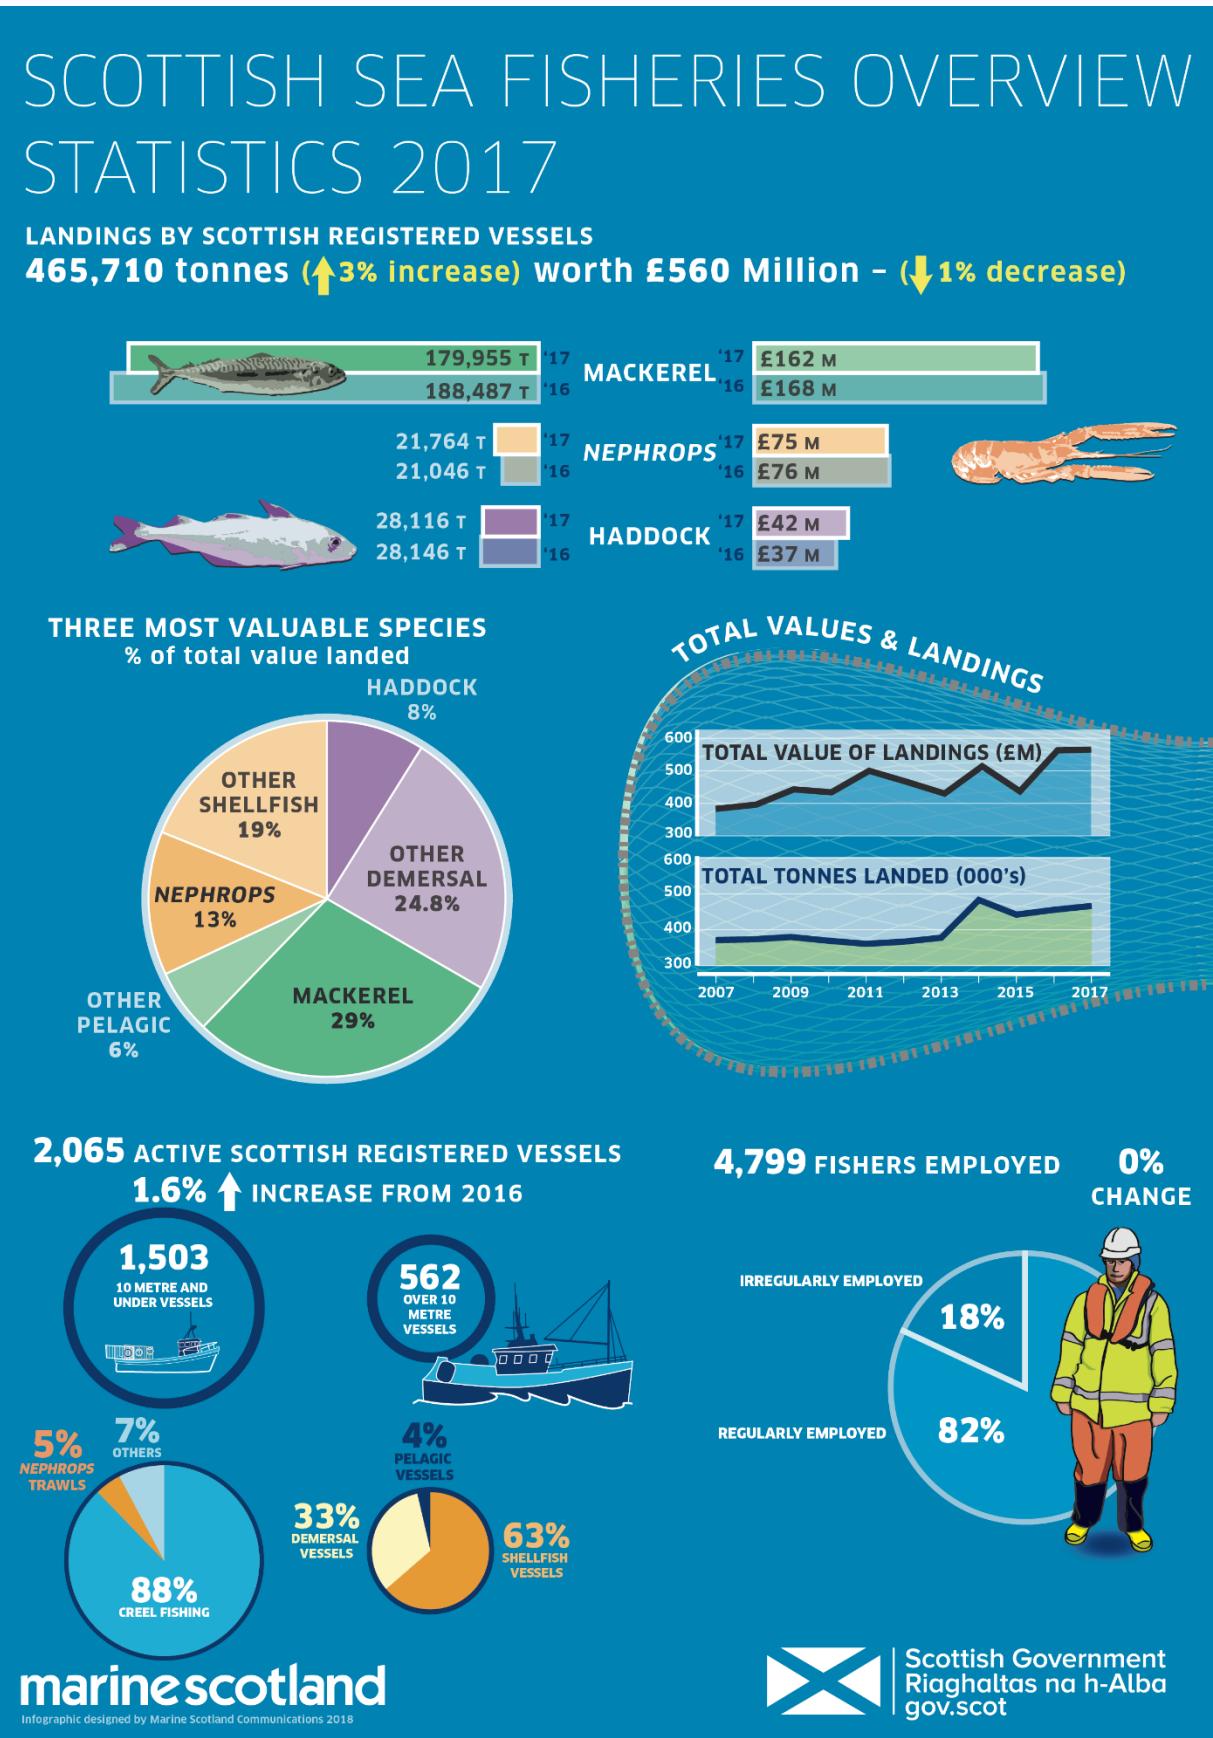

There were 2,065 active Scottish fishing vessels in 2017, an increase of 32 vessels (two per cent) from 2016. In 2017, the number of over ten metre vessels was 562, down four vessels from 2016. The over ten metre demersal sector consisted of 184 vessels, a decrease of two, while the pelagic sector increased by one to 20 vessels. The number of vessels in the shellfish sector decreased by three to 358 vessels.

There were 1,503 vessels in the ten metre and under fleet, an increase of 39 vessels (three per cent) compared to 2016. Creel fishing dominated the ten metre and under fleet with 1,323 vessels (88 per cent) using this main fishing method.

## 2.2. Employment

There were 4,799 fishers employed on Scottish based vessels at the end of 2017. This figure is consistent with 2016 (less than one per cent change). Compared to 2016, there were 98 more regularly employed fishers (three per cent increase), 77 fewer irregularly employed fishers (eight per cent decrease) and 45 fewer crofters (88% decrease). This large change in crofters may represent difficulties in accurately identifying crofters.

Figure 1. Overview Statistics – Infographic

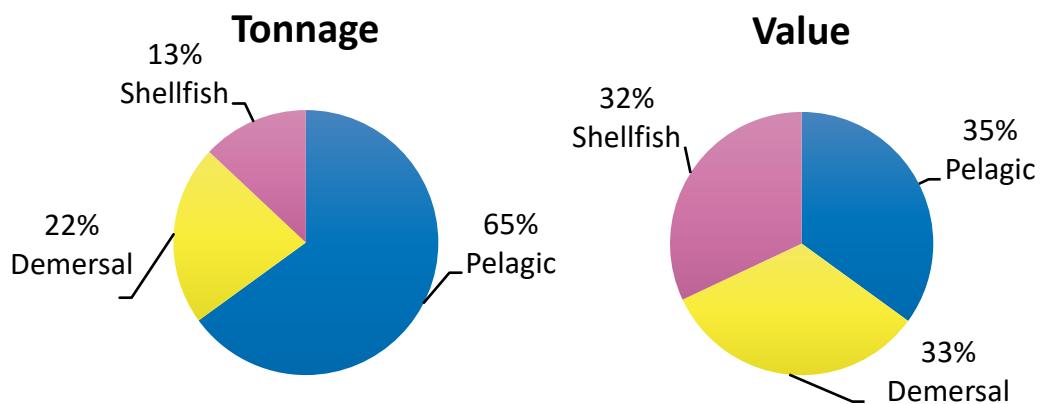

### 3. Landings

#### 3.1. Landings by Scottish vessels by species type

Landings by Scottish vessels accounted for 57 per cent of the value and 64 per cent of the tonnage of all landings by UK vessels in 2017 (Table 22, page 60). Compared to 2016, this Scottish share of the total UK value has decreased by one percentage point and tonnage has remained more-or-less unchanged (less than one percentage point change).

Chart 2. Percentage of Scottish vessels' landings by species type

In 2017, demersal species represented 22 per cent of the tonnage of all landings (102 thousand tonnes) and 33 per cent of the value (£184 million). Pelagic species represented 65 per cent by tonnage (301 thousand tonnes) and 35 per cent of value (£197 million). Shellfish landings accounted for 13 per cent of tonnage (62 thousand tonnes) and 32 per cent by value (£180 million). This highlights the general difference in prices: Shellfish and demersal species generally tend to attract higher prices than pelagic species.

The one per cent decrease in the real terms value of landings by Scottish vessels to £560 million between 2016 and 2017 was driven by a decrease in the value of pelagic species (Chart 4). The real terms value of pelagic landings decreased by 13 per cent from 2016 whereas shellfish landings increased 6 per cent and demersal landings 7 per cent.

##### *Pelagic species*

In 2017, the real value of mackerel fell by six per cent and tonnage fell five per cent. The real value of herring fell by 46 per cent and tonnage landed by 14 per cent since 2016. The increase in tonnage of pelagic species landed is due to a sharp increase in landings of blue whiting, likely because of a rise in the available quota for this species (28 thousand tonnes up). In 2017, 63 thousand tonnes of blue whiting worth £11 million was landed by Scottish vessels, an increase of 71 per cent in tonnage and 24 per cent in real value. This explains the modest increase in pelagic tonnage landed in spite of a reduction in total value, as blue whiting is largely caught for the

low value industrial market and is not landed for human consumption, hence it attracts a lower price at market (£170 per tonne in 2017).

Chart 3. Tonnage of landings by Scottish vessels by species type 2008 to 2017

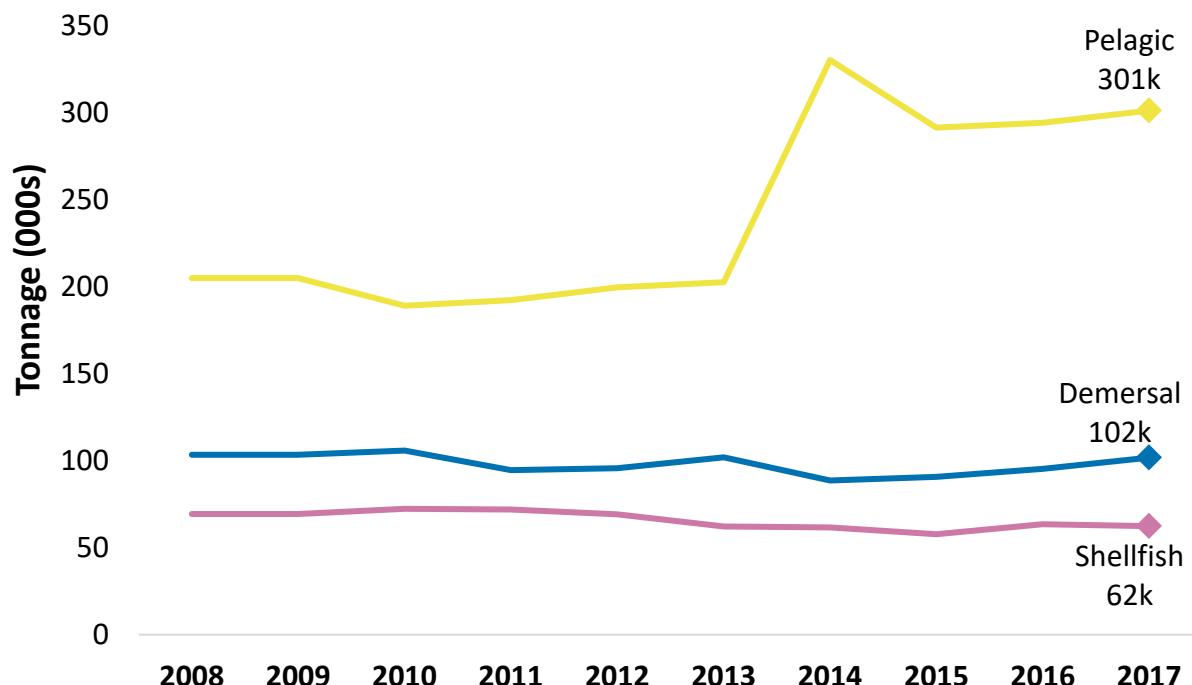

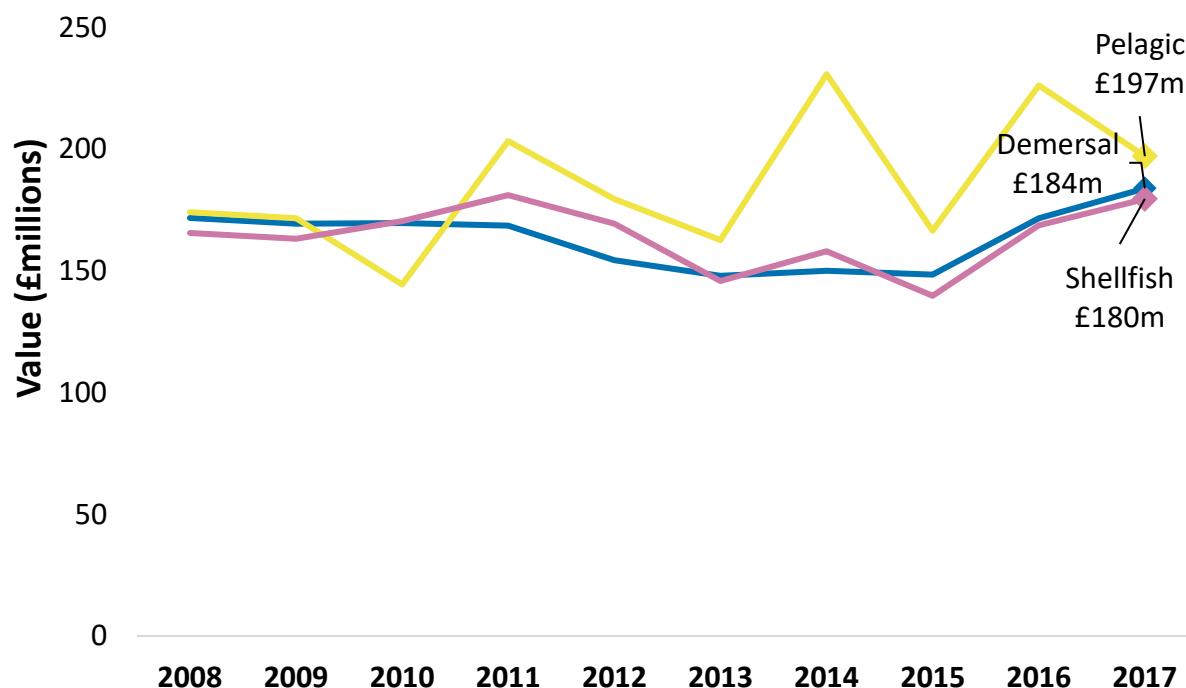

Chart 4. Real value of landings by Scottish vessels by species type 2008 to 2017

### *Demersal species*

Most demersal species increased in real terms value with modest decreases in the value of hake and megrims. Haddock is the most valuable demersal species and represented eight per cent of the total value of Scottish landings and 23 per cent of the value of demersal landings in 2017. Monkfish accounted for six per cent of the total value of Scottish landings and 20 per cent of the value of demersal landings in 2017. Cod accounted for six per cent of the value of Scottish landings and 19 per cent of demersal landings in 2017.

### *Shellfish species*

Crabs and lobsters make up a small proportion of overall value landed by Scottish vessels but are important for Scotland's large inshore fleet. Tonnage of edible crabs increased from 2016 by three per cent to 11 thousand tonnes and the value in real terms increased by 27 per cent to £20 million. Tonnage of lobsters increased by six per cent to 1.2 thousand tonnes and the value in real terms increased by 23 per cent to £17 million. This reflects the high prices for shellfish, with the prices of crabs rising by 22 per cent and lobsters by 16 per cent in real terms from 2016 to 2017.

The 2017 price per tonne for each species is presented in Table 23 on page 62 for the period 2013 to 2017.

Chart 5. Real terms price per tonne for key species (value of £20 million or over landed by Scottish vessels) 2016 and 2017

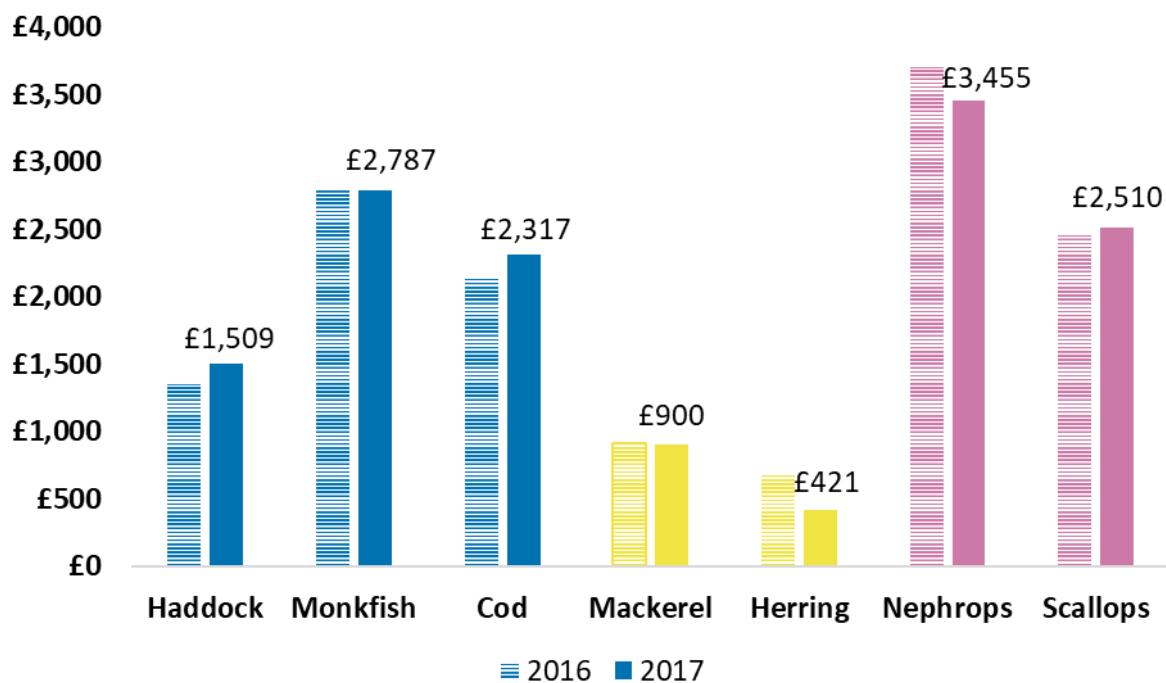

Chart 6. Trend in tonnage landed by Scottish vessels 2008 to 2017

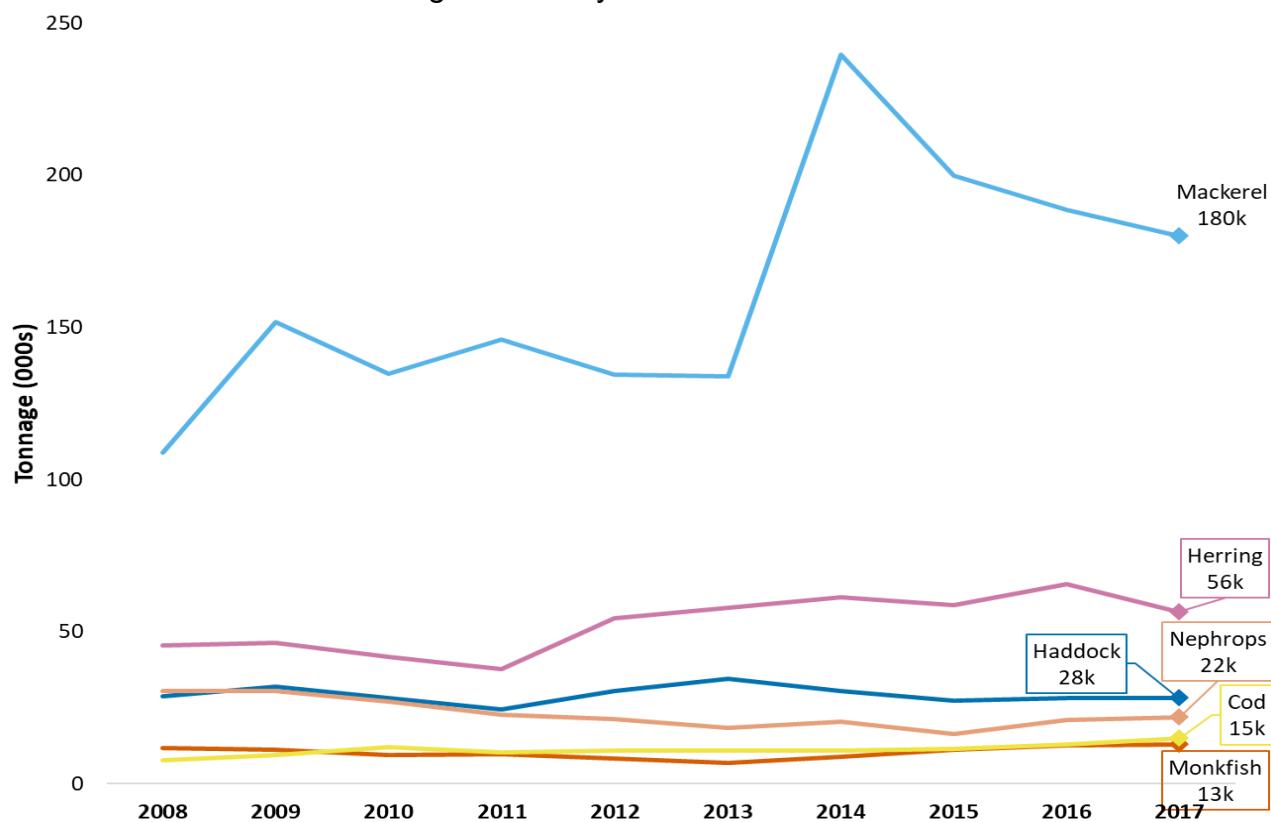

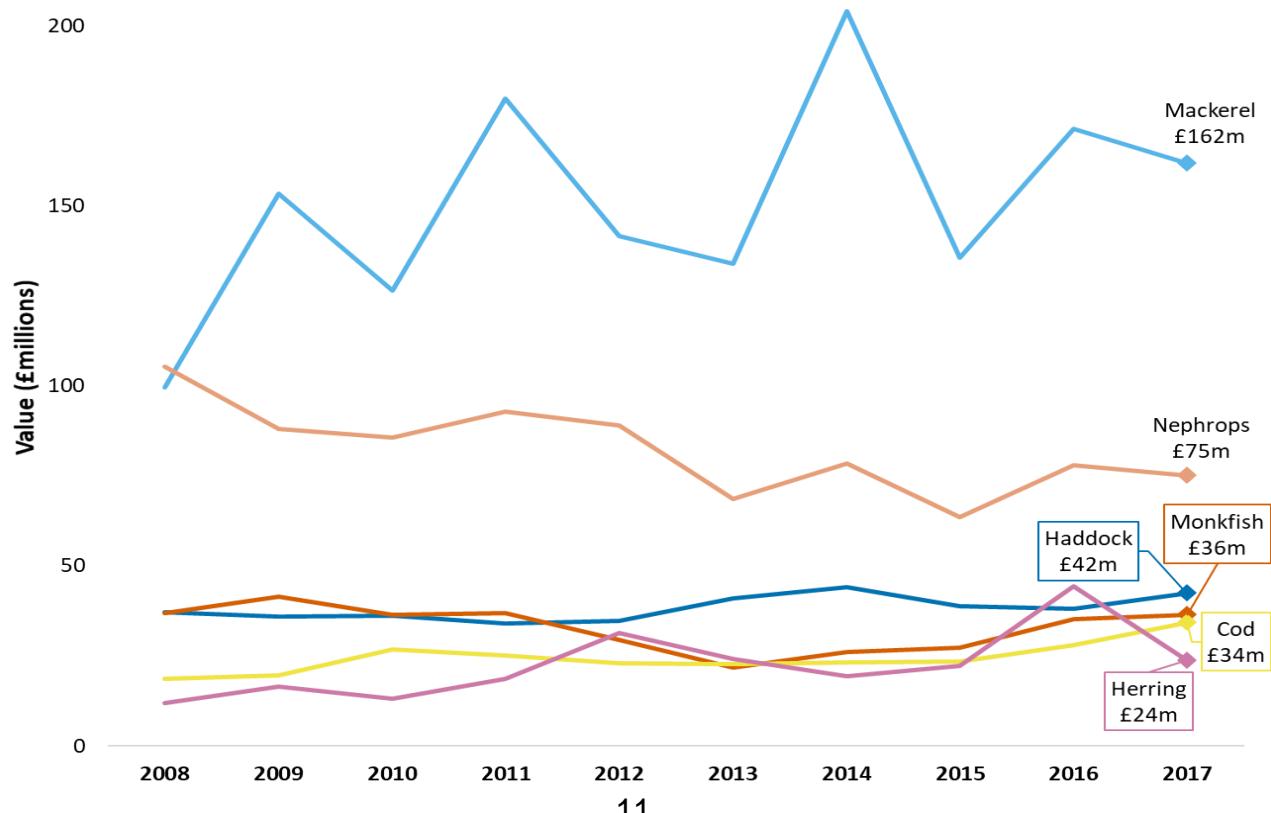

Chart 7. Trend in real value (in 2017 prices) of key species with a value of £20 million or over landed by Scottish vessels 2008 to 2017

### 3.2. Landings abroad by Scottish vessels

In 2017, Scottish vessels landed abroad 180 thousand tonnes of sea fish and shellfish, worth £121 million. The tonnage landed abroad increased by 12 per cent and the real terms value of landings abroad decreased by 11 per cent in since 2016 (Table 4 on page 42). Norway is by far the largest destination for Scottish vessels landing abroad, accounting for 62 per cent by tonnage and 74 per cent by value of all Scottish vessels' landings abroad. Landings into Norway were comparable to 2016 by tonnage (less than one per cent change) and the value of these landings have fallen by eight per cent (Table 25 on page 64).

Landings abroad accounted for 39 per cent of all landings by Scottish vessels in terms of tonnage and 22 per cent in terms of value. Of this, 93 per cent of the tonnage landed abroad was pelagic, six per cent was demersal and less than one per cent was shellfish. The main species landed abroad was mackerel, and with a value of £70 million, this represents 53 per cent of the total value of fish landed abroad in 2017. Since 2016, mackerel landings abroad have increased in tonnage by three per cent and decreased in real terms value by three per cent. There were 95 thousand tonnes of mackerel landed abroad, which is 53 per cent of the total tonnage of mackerel landed by Scottish vessels. The price for mackerel landed into the UK in 2017 was, on average, £906 per tonne, while mackerel landed abroad received an average of £893 per tonne. This is a reversal of the previous trend that mackerel prices were higher abroad than in the UK.

Nearly all of Scottish landings into Norway were of pelagic species. In 2017, 90 per cent of the value of landings into Norway was for mackerel, amounting to 90 thousand tonnes with a value of £80 million. Key countries for demersal landings were the Netherlands and Denmark. Scottish vessels landed 12 thousand tonnes of demersal species abroad with a value of £15 million. Only 850 tonnes of shellfish were landed abroad by Scottish vessels in 2017, mainly into Ireland and the Netherlands.

Chart 8. Percentage of tonnage (L) and value (R) landed abroad by Scottish vessels by species type in 2017

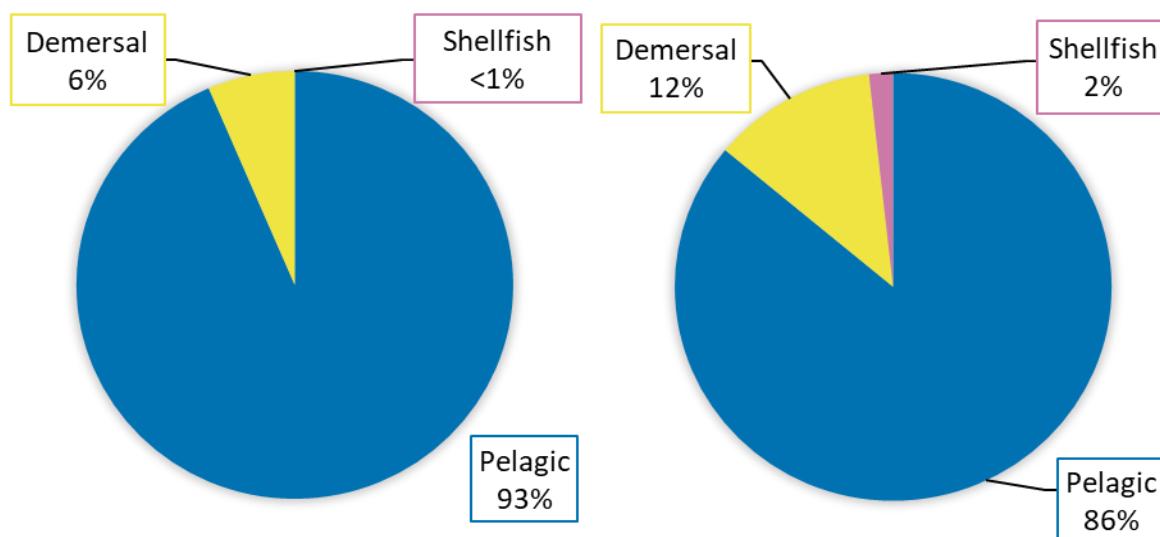

Figure 2. Tonnage landed abroad by Scottish vessels by country of landing and species type

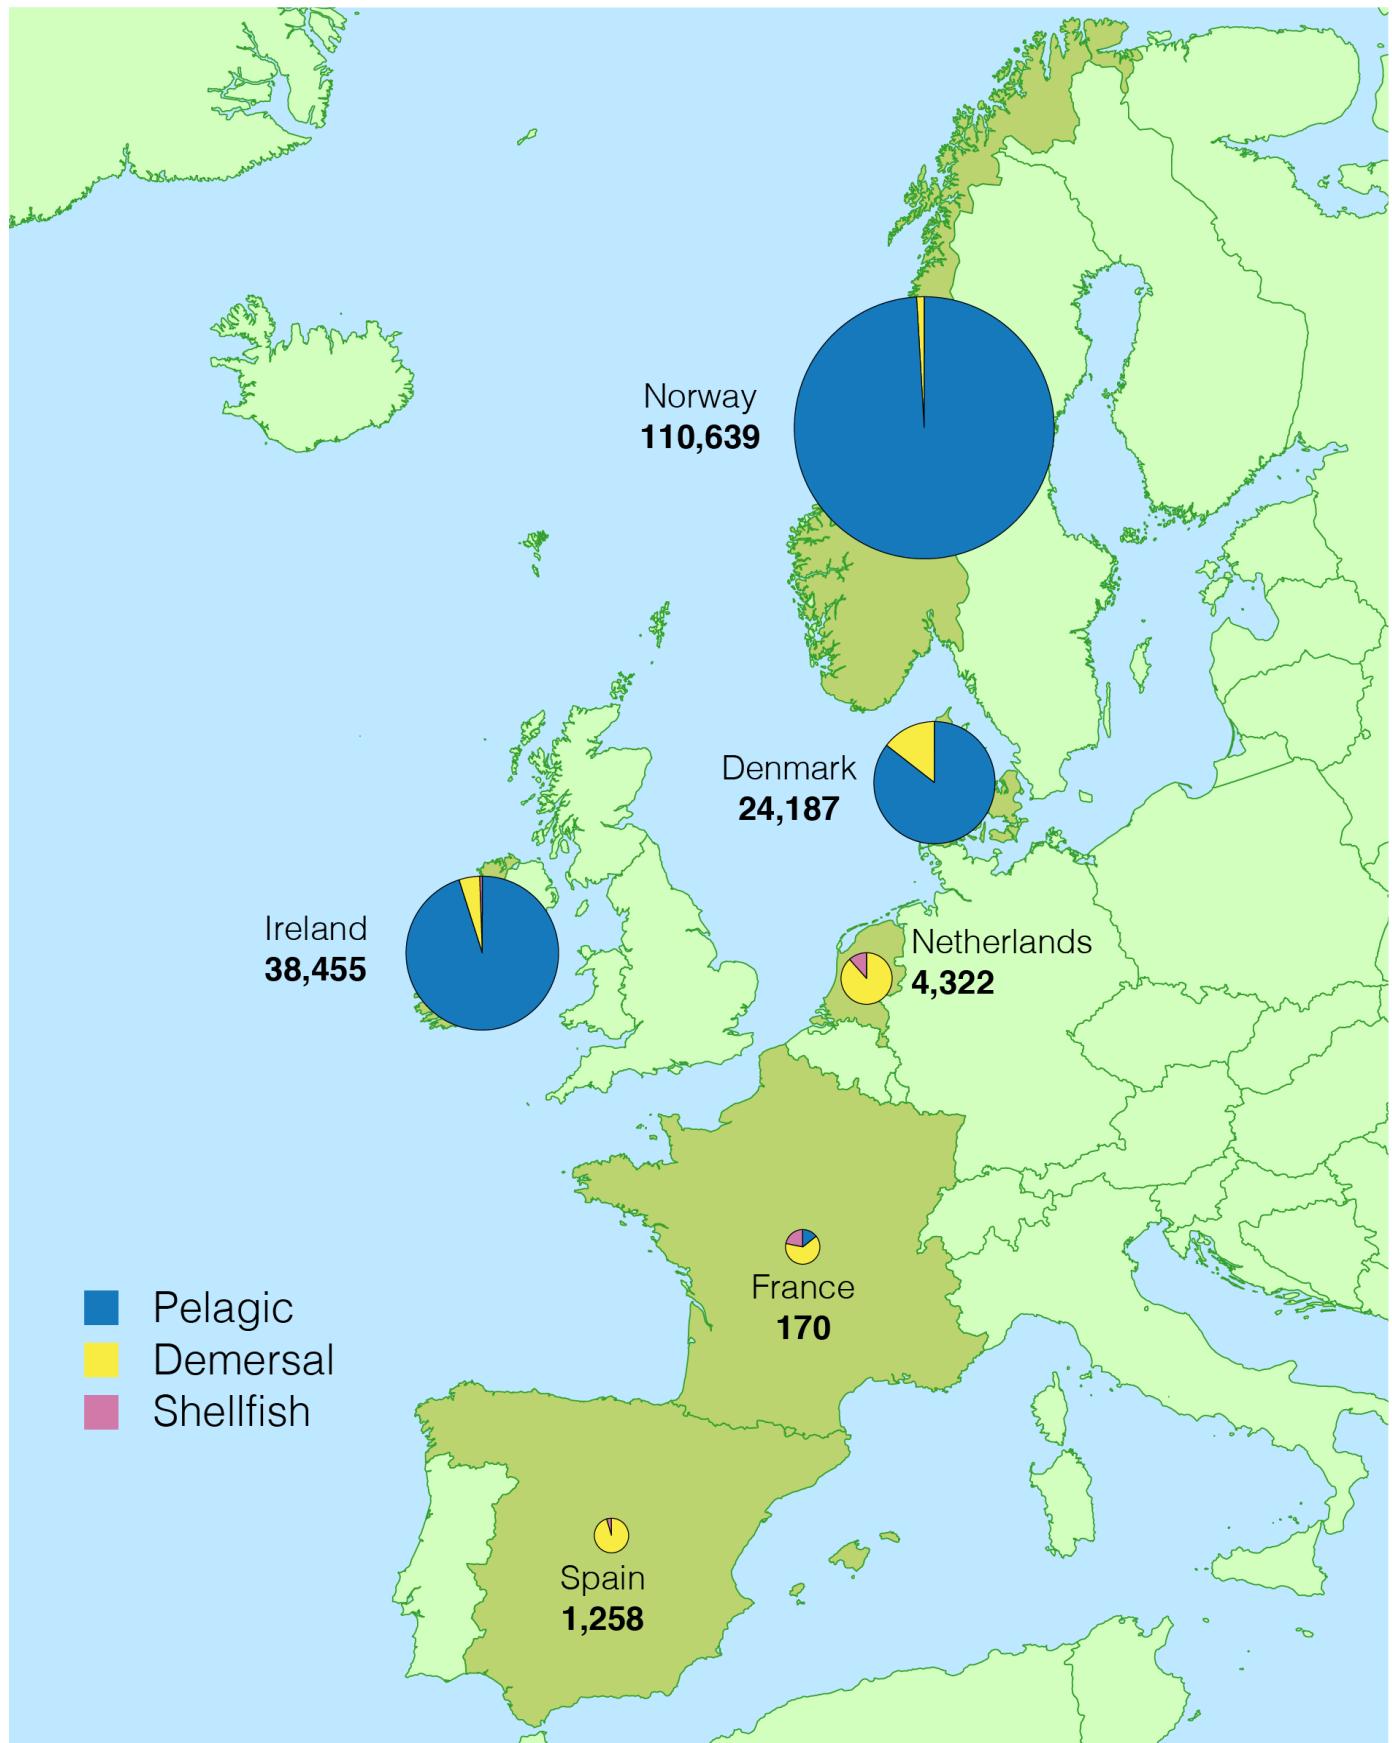

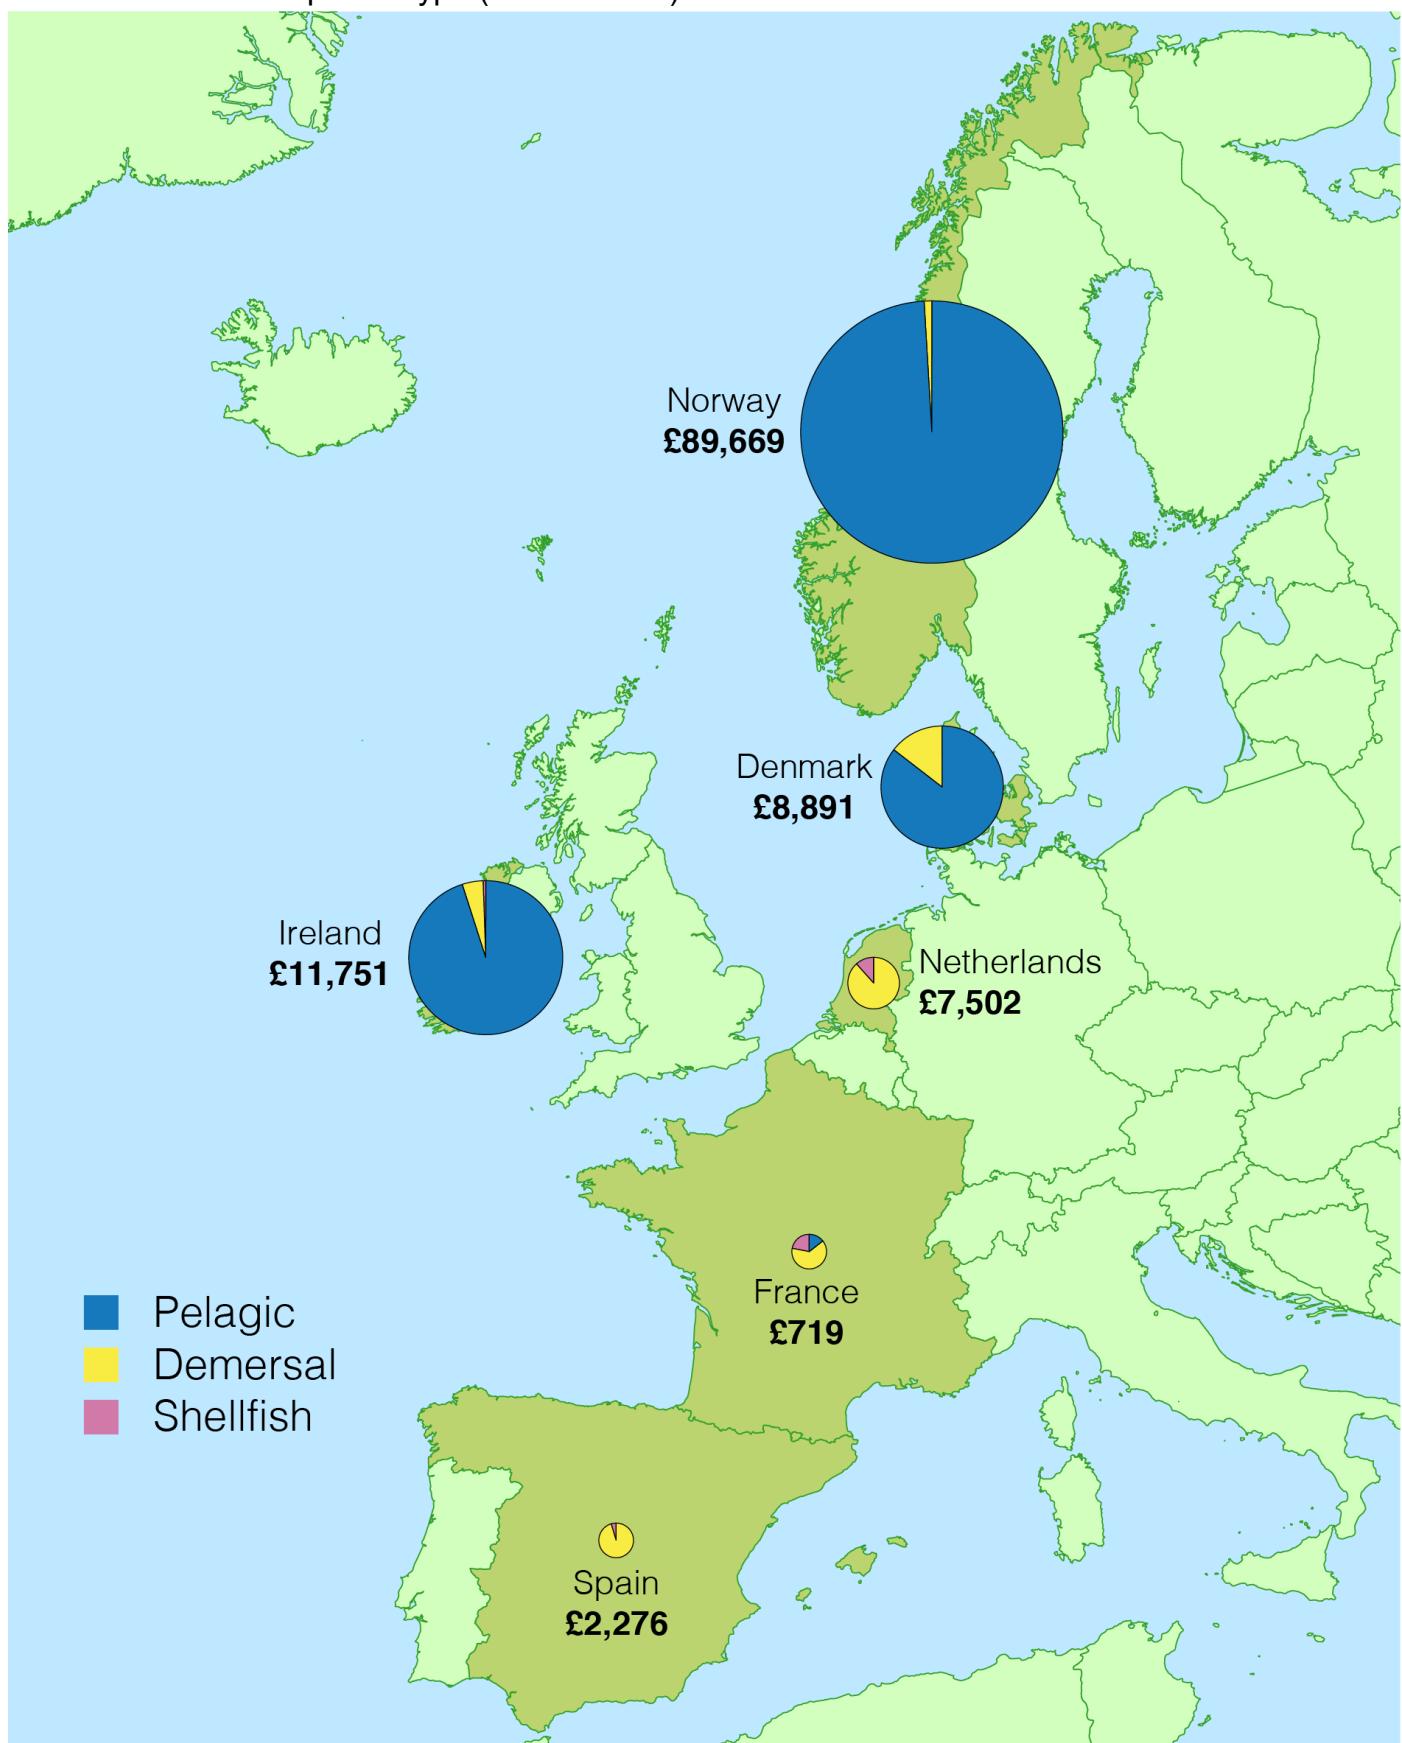

Figure 3. Value of landings abroad by Scottish vessels by country of landing and species type (£' thousands)

### 3.3. Landings by area of capture

Scottish vessels are most active in two main ICES Rectangles : the Northern North Sea (ICES division IVa) and the West Coast of Scotland (ICES division VIa) (Figure 2 and Figure 3). In the Northern North Sea (IVa), 215 thousand tonnes of sea fish and shellfish were caught with a value of £275 million, representing 46 per cent of the tonnage and 49 per cent of the value of all landings by Scottish vessels (Table 28 on page 69). Almost two fifths (38 per cent) of landings by Scottish vessels by tonnage were caught in the West Coast of Scotland (VIa), providing one third (33 per cent) of the total value of all Scottish landings. The rest of Area VII (i.e. not the Irish Sea) accounted for three per cent activity from demersal and less than one per cent of the pelagic and shellfish tonnage. One per cent of the tonnage of all landings was caught in this area.

By species type, 69 per cent of the tonnage of all demersal landings by Scottish vessels was caught in the Northern North Sea (IVa), and only 13% in the West Coast of Scotland (VIa). For pelagic landings, 43 per cent by tonnage were caught in the Northern North Sea (IVa) and 47 per cent were caught in the West Coast of Scotland (VIa).

More tonnage of shellfish species was caught in the West Coast than in the Northern North Sea. The Central North Sea (ICES division IVb) and the Irish Sea (VIIa) are also areas of considerable activity for shellfish fisheries. By tonnage, shellfish catches from the West of Scotland accounted for 34 per cent of all shellfish landings and 27 per cent of shellfish landings were caught in the Northern North Sea (IVa). 19 per cent of shellfish catches are from the Central North Sea (IVb) and eight per cent are from the Irish Sea (VIIa), where almost all catches from the Irish Sea are of shellfish species.

Further data on fishing activity in the seas around the UK by Scottish vessels, other UK vessels and foreign vessels that land into the UK are available on the ICES rectangle webpage on the Scottish Sea Fisheries Statistics website (see Annex 3 page 37). These data show the tonnage and value of landings by species type and fishing effort by ICES rectangle. Maps on fishing activity in Scottish waters by Scottish vessels, other UK vessels, and foreign vessels that land into the UK will be available on the National Marine Plan Interactive (NMPi) webpage.

Figure 4. Tonnage landed by Scottish vessels by area of capture and species type

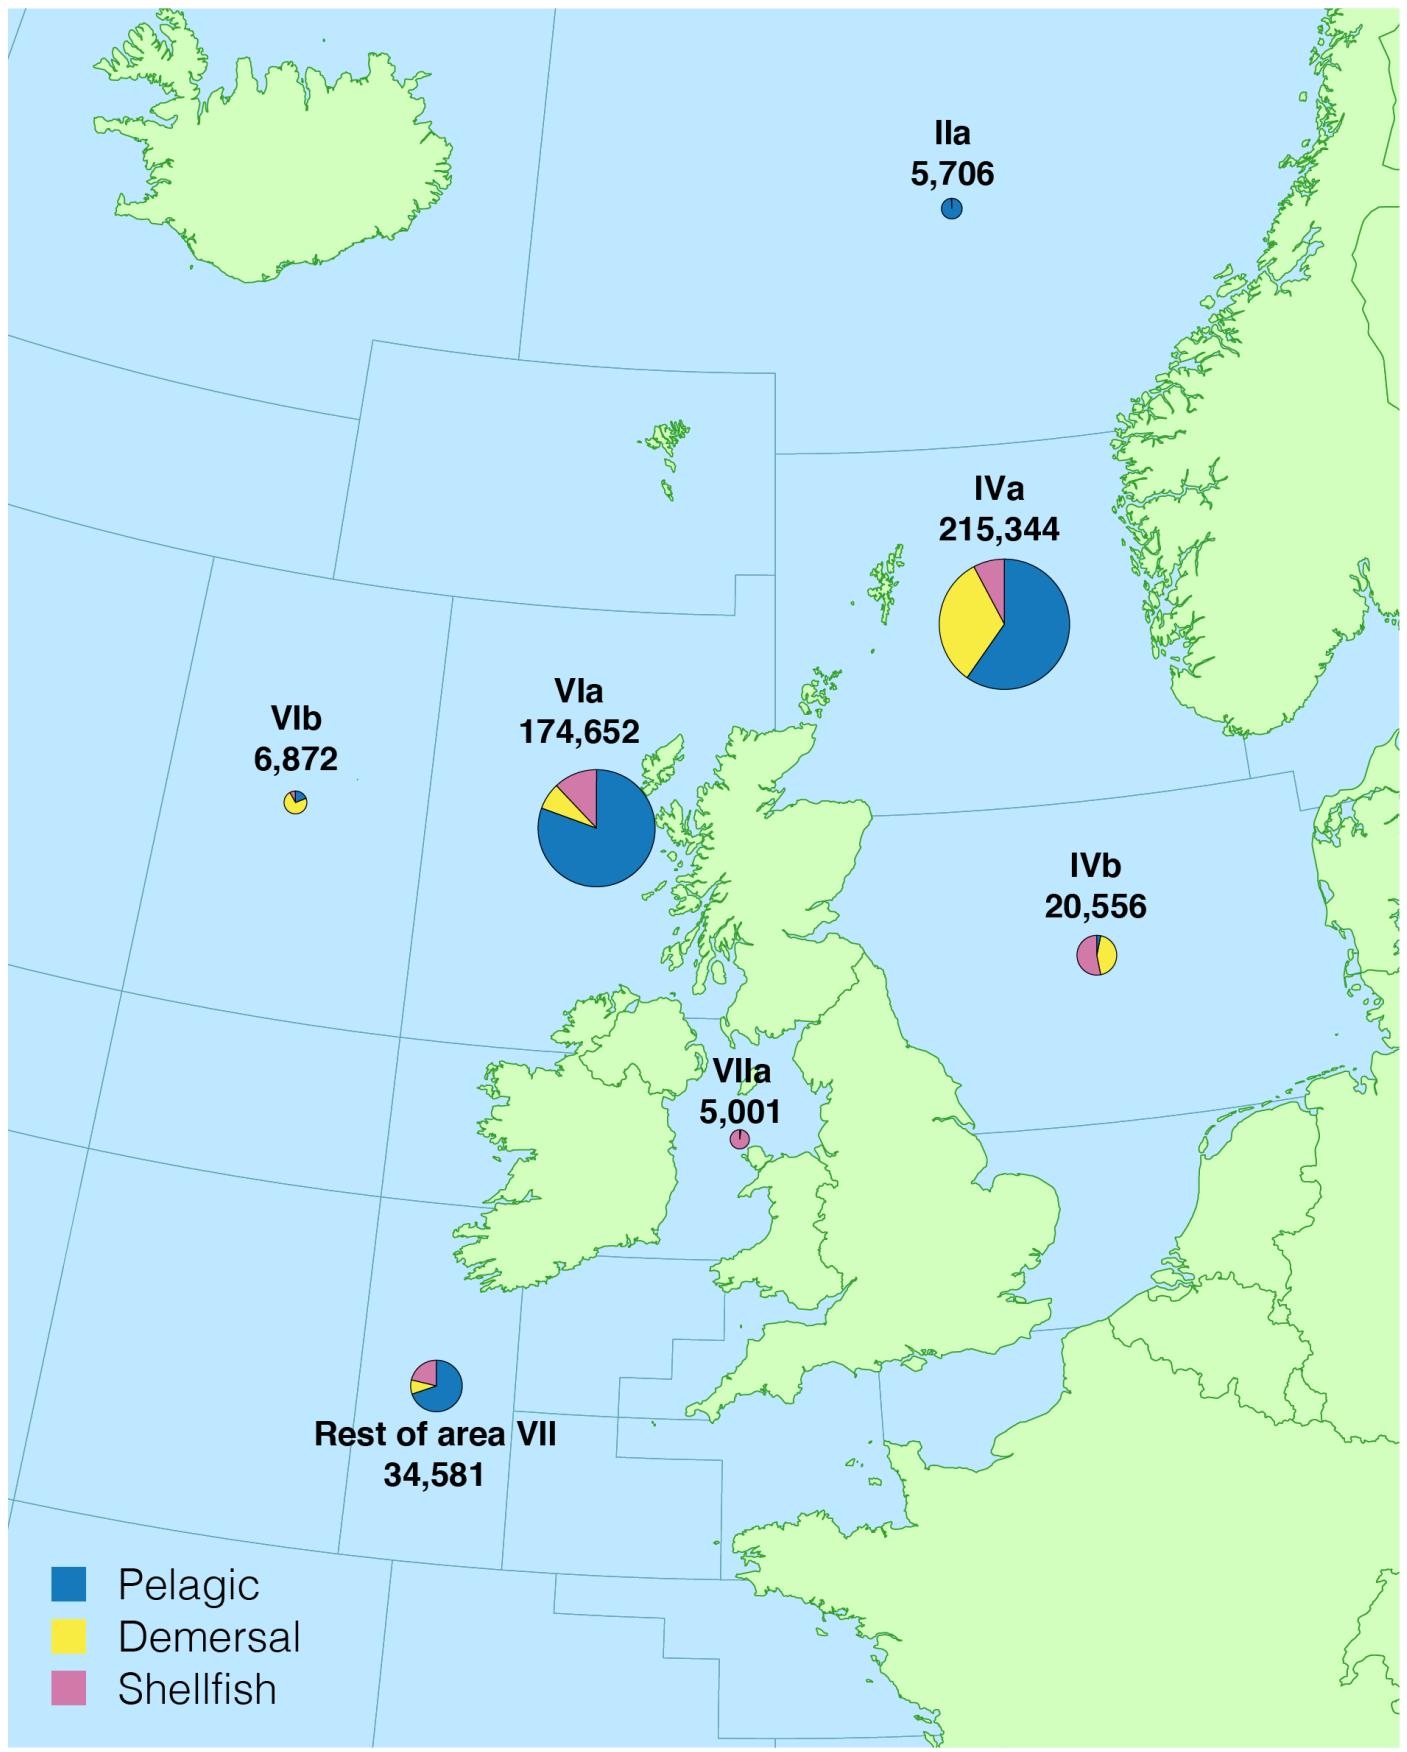

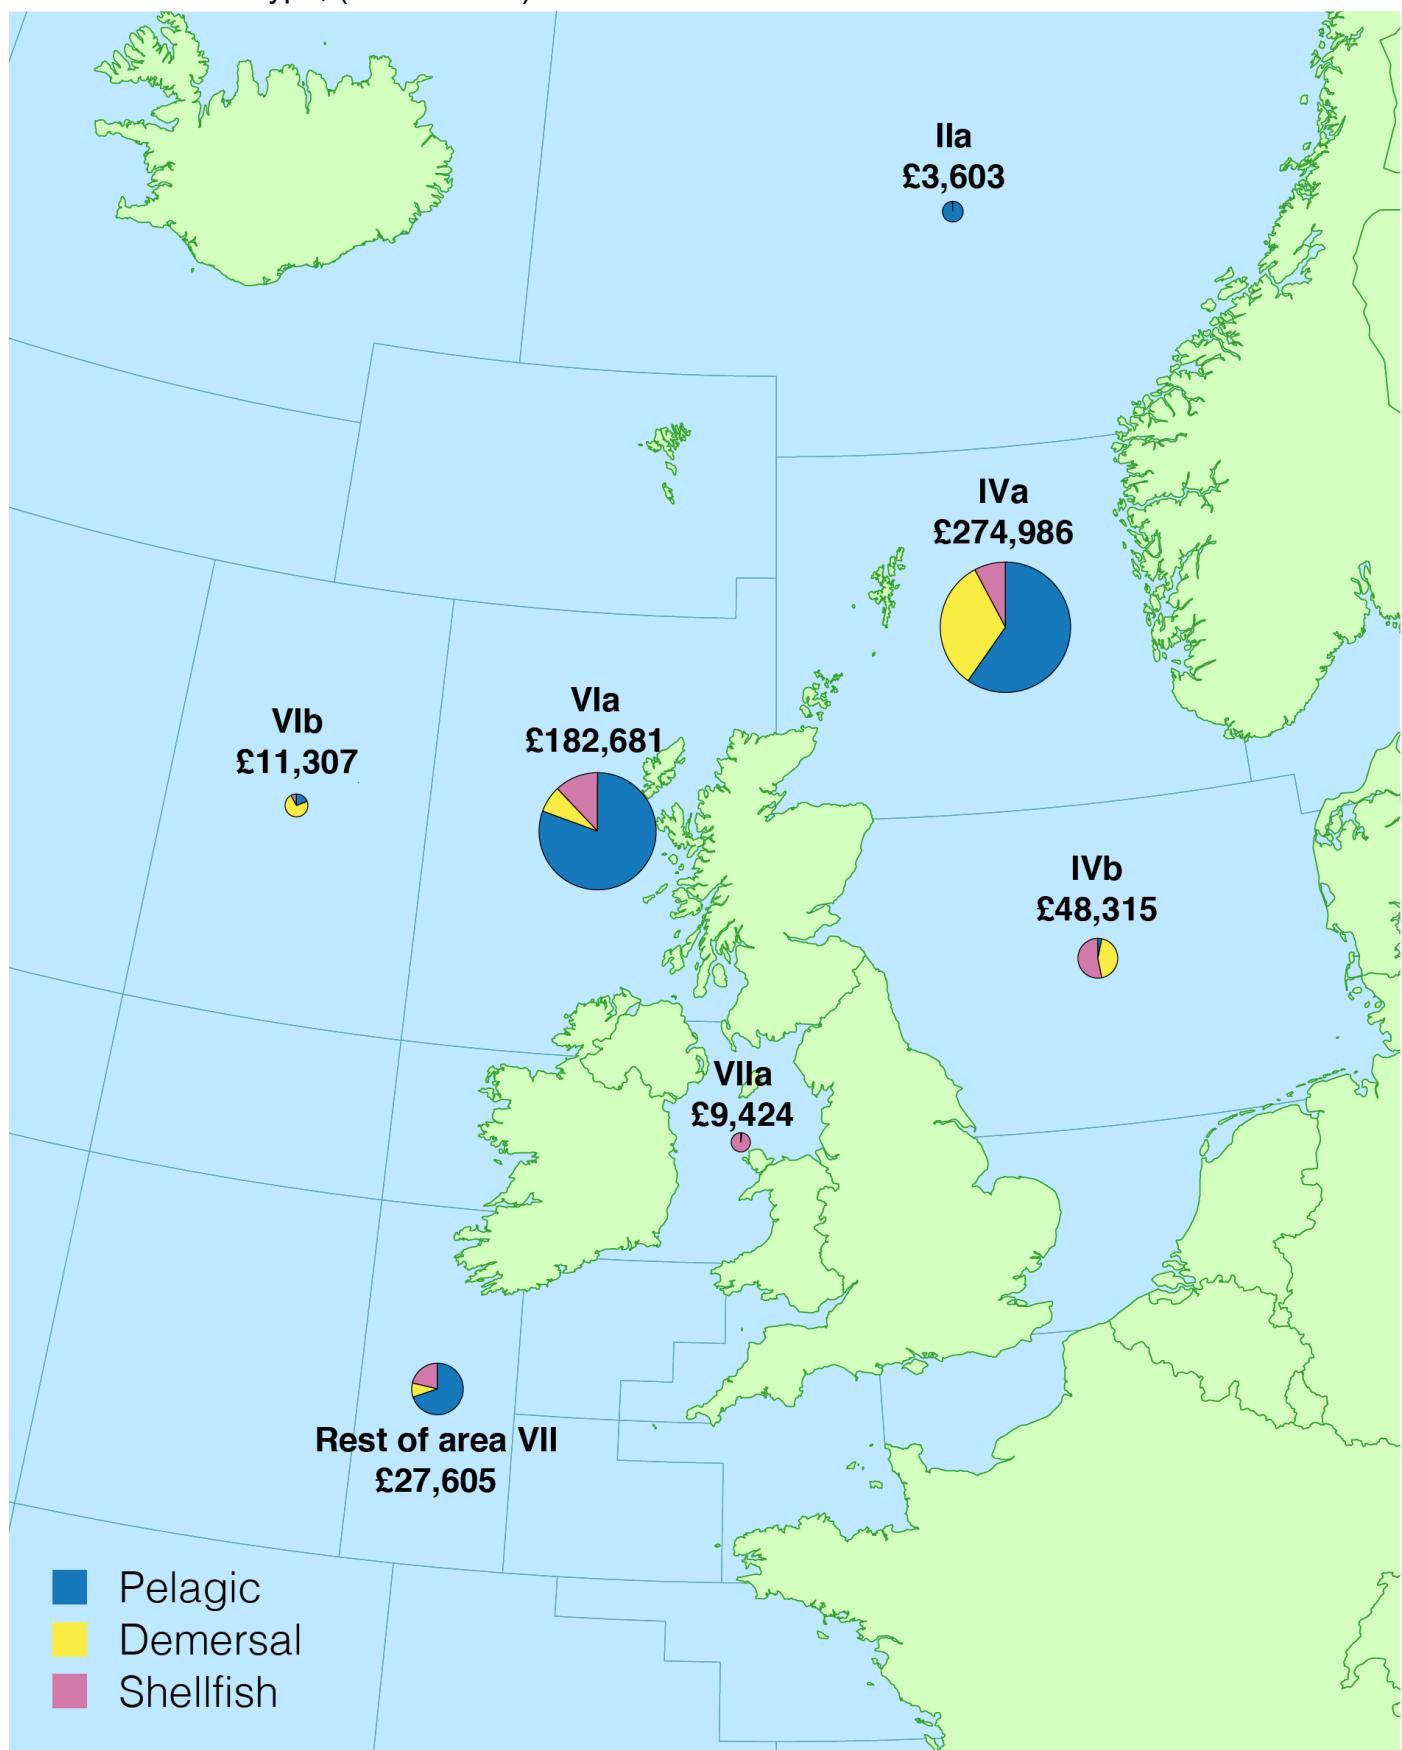

Figure 5. Value of landings by Scottish vessels by area of capture and species type, (£'thousands)

### 3.4. All landings into Scotland

In 2017, there were 341 thousand tonnes of sea fish and shellfish landed into Scotland with a value of £505 million. This represents a two per cent decrease in both tonnage and in real value since 2016. Landings of demersal species accounted for 40 per cent, pelagic species - 45 per cent and shellfish species - 15 per cent of the total tonnage landed into Scotland. By value, 48 per cent of landings into Scotland were demersal, 21 per cent were pelagic and 31 per cent were shellfish species. The differences in shares by tonnage and value reflect the differences in average prices per tonne across the species types: shellfish sell at relatively higher average prices per tonne, whilst pelagic species receive the lowest average prices per tonne (Table 23 on page 62).

Figure 6 and Figure 7 show landings by all vessels by species type into the eighteen Scottish port districts (also in Table 29 on page 70). Landings into the south-west coast and south-east coast were dominated by shellfish, while landings into the north-west coast were mostly demersal and the north-east coast were mostly pelagic landings. The three largest districts in Scotland in terms of total tonnage landed were Peterhead (east coast), Shetland (north) and Fraserburgh (east coast). Peterhead is the single largest fishing port in the UK by tonnage and value landed there.

Combined, the top three districts on tonnage accounted for 74 per cent of total weight landed and 60 per cent of value of all landings into Scotland. Peterhead had 163 thousand tonnes landed in 2017 with a value of £179 million. This represents a two per cent increase in tonnage and a one per cent increase in real terms value. By tonnage, 61 per cent of the landings into Peterhead comprised pelagic species and these accounted for 37 per cent of the landings value into the district. In contrast, 36 per cent of the tonnage landed into Peterhead was demersal species that accounted for 54 per cent of the value.

Landings into Shetland totalled 63 thousand tonnes (down 12 per cent) and were valued at £77 million (down four per cent). As with Peterhead, the majority of landings into Shetland were of pelagic species, which represented 63 per cent of the total tonnage landed and 39 per cent of the total value of landings. Demersal species accounted for one third (33 per cent) of the tonnage landed and 53 per cent of the value landed into Shetland.

Landings into Fraserburgh totalled 27 thousand tonnes worth £48 million. The largest landings were pelagic species, which represented 42 per cent of the tonnage landed and 20 per cent of the total value of landings. Demersal species accounted for one third of the tonnage and 32 per cent of the value landed into Fraserburgh, whereas shellfish species accounted for 25 per cent of the tonnage and 47 per cent of the value.

Most of the West and North coast (including Orkney and Shetland) districts reported a decrease in tonnage and value of landings in 2017. Kinlochbervie reported a three per cent decrease in tonnage but a two per cent increase in value. Ullapool reported a 12 per cent increase in tonnage but a 13 per cent decrease in value.

Figure 6. Tonnage landed into Scotland by all vessels by district and species type, 2017

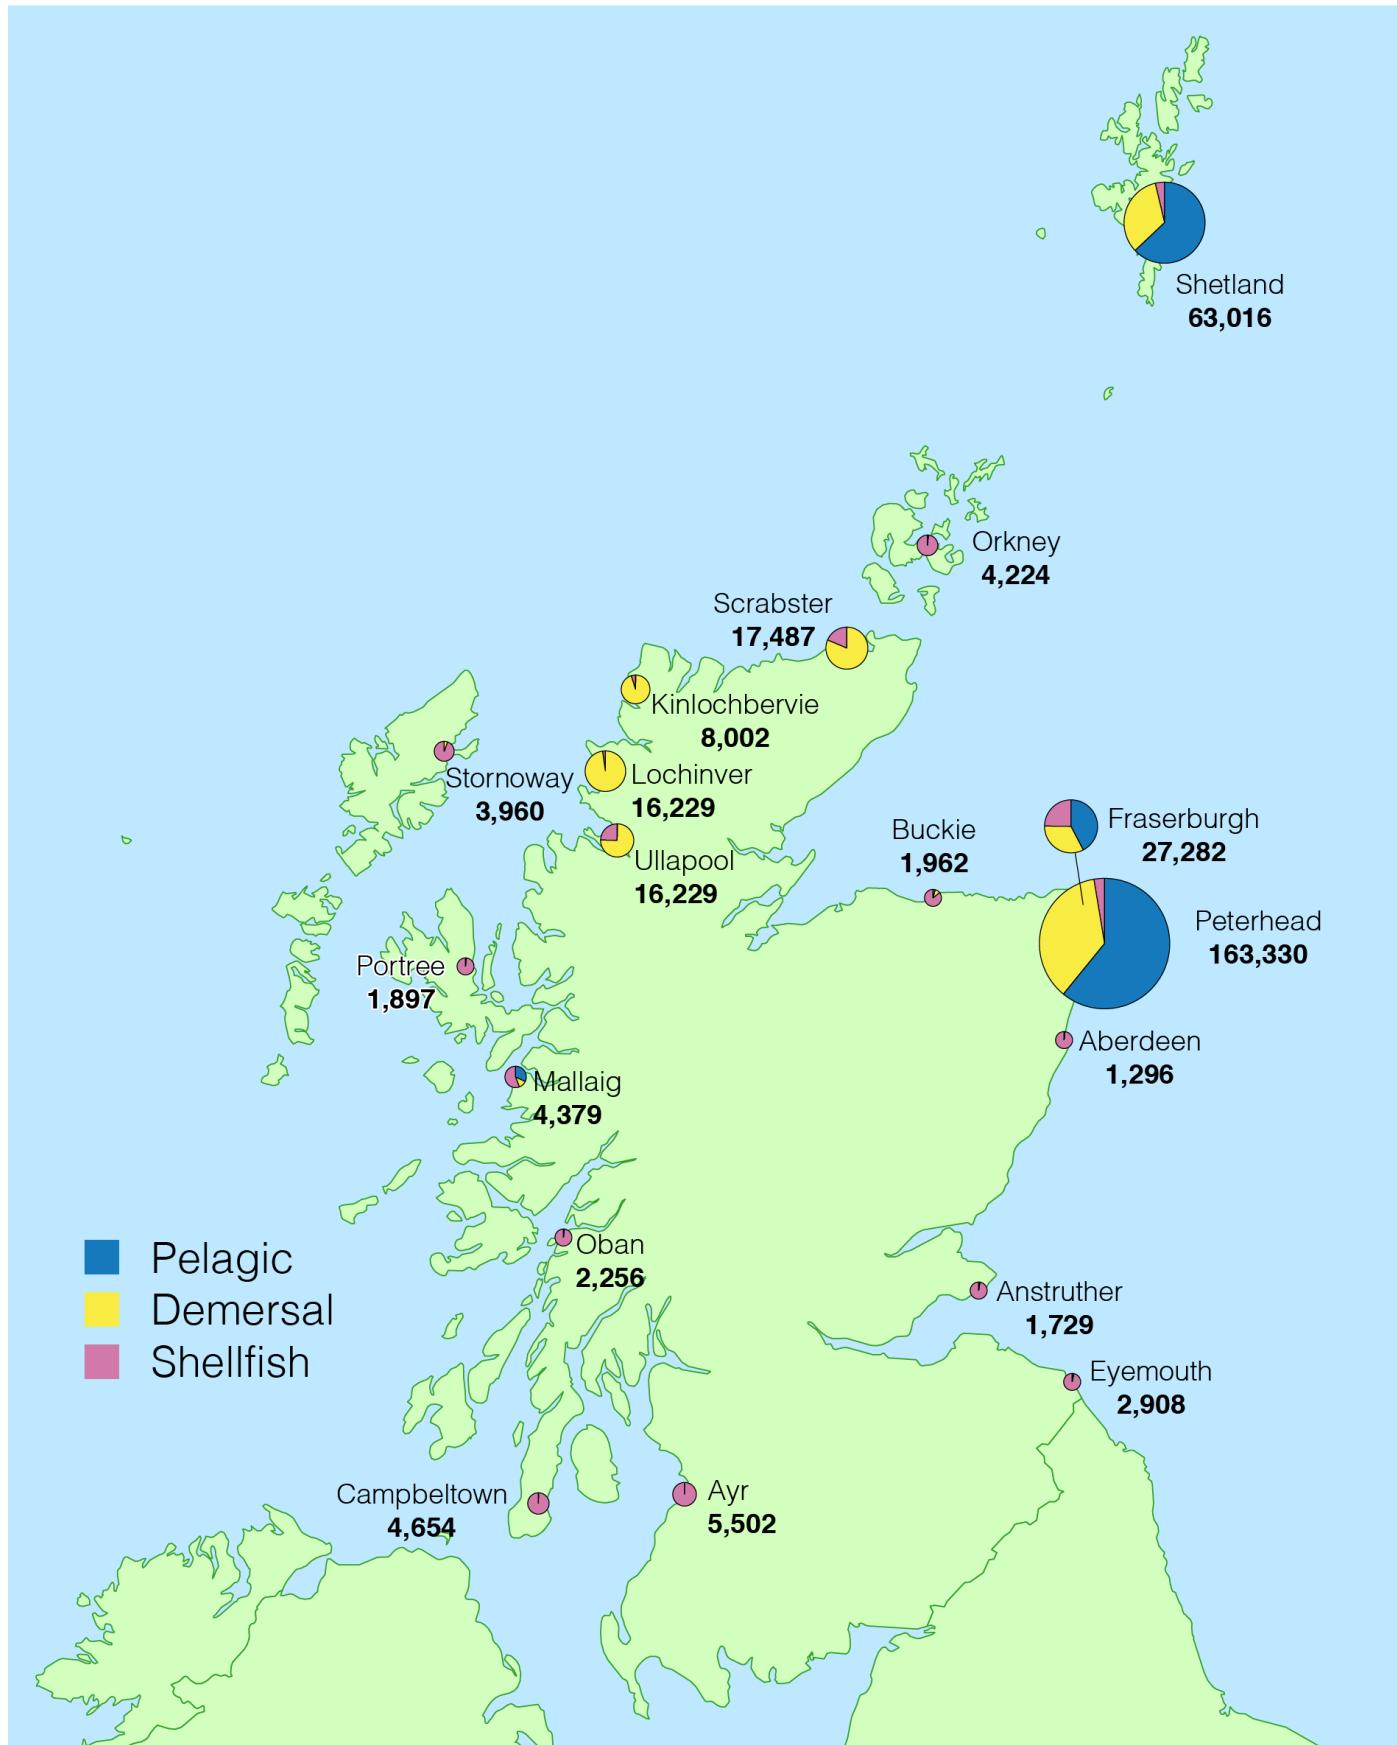

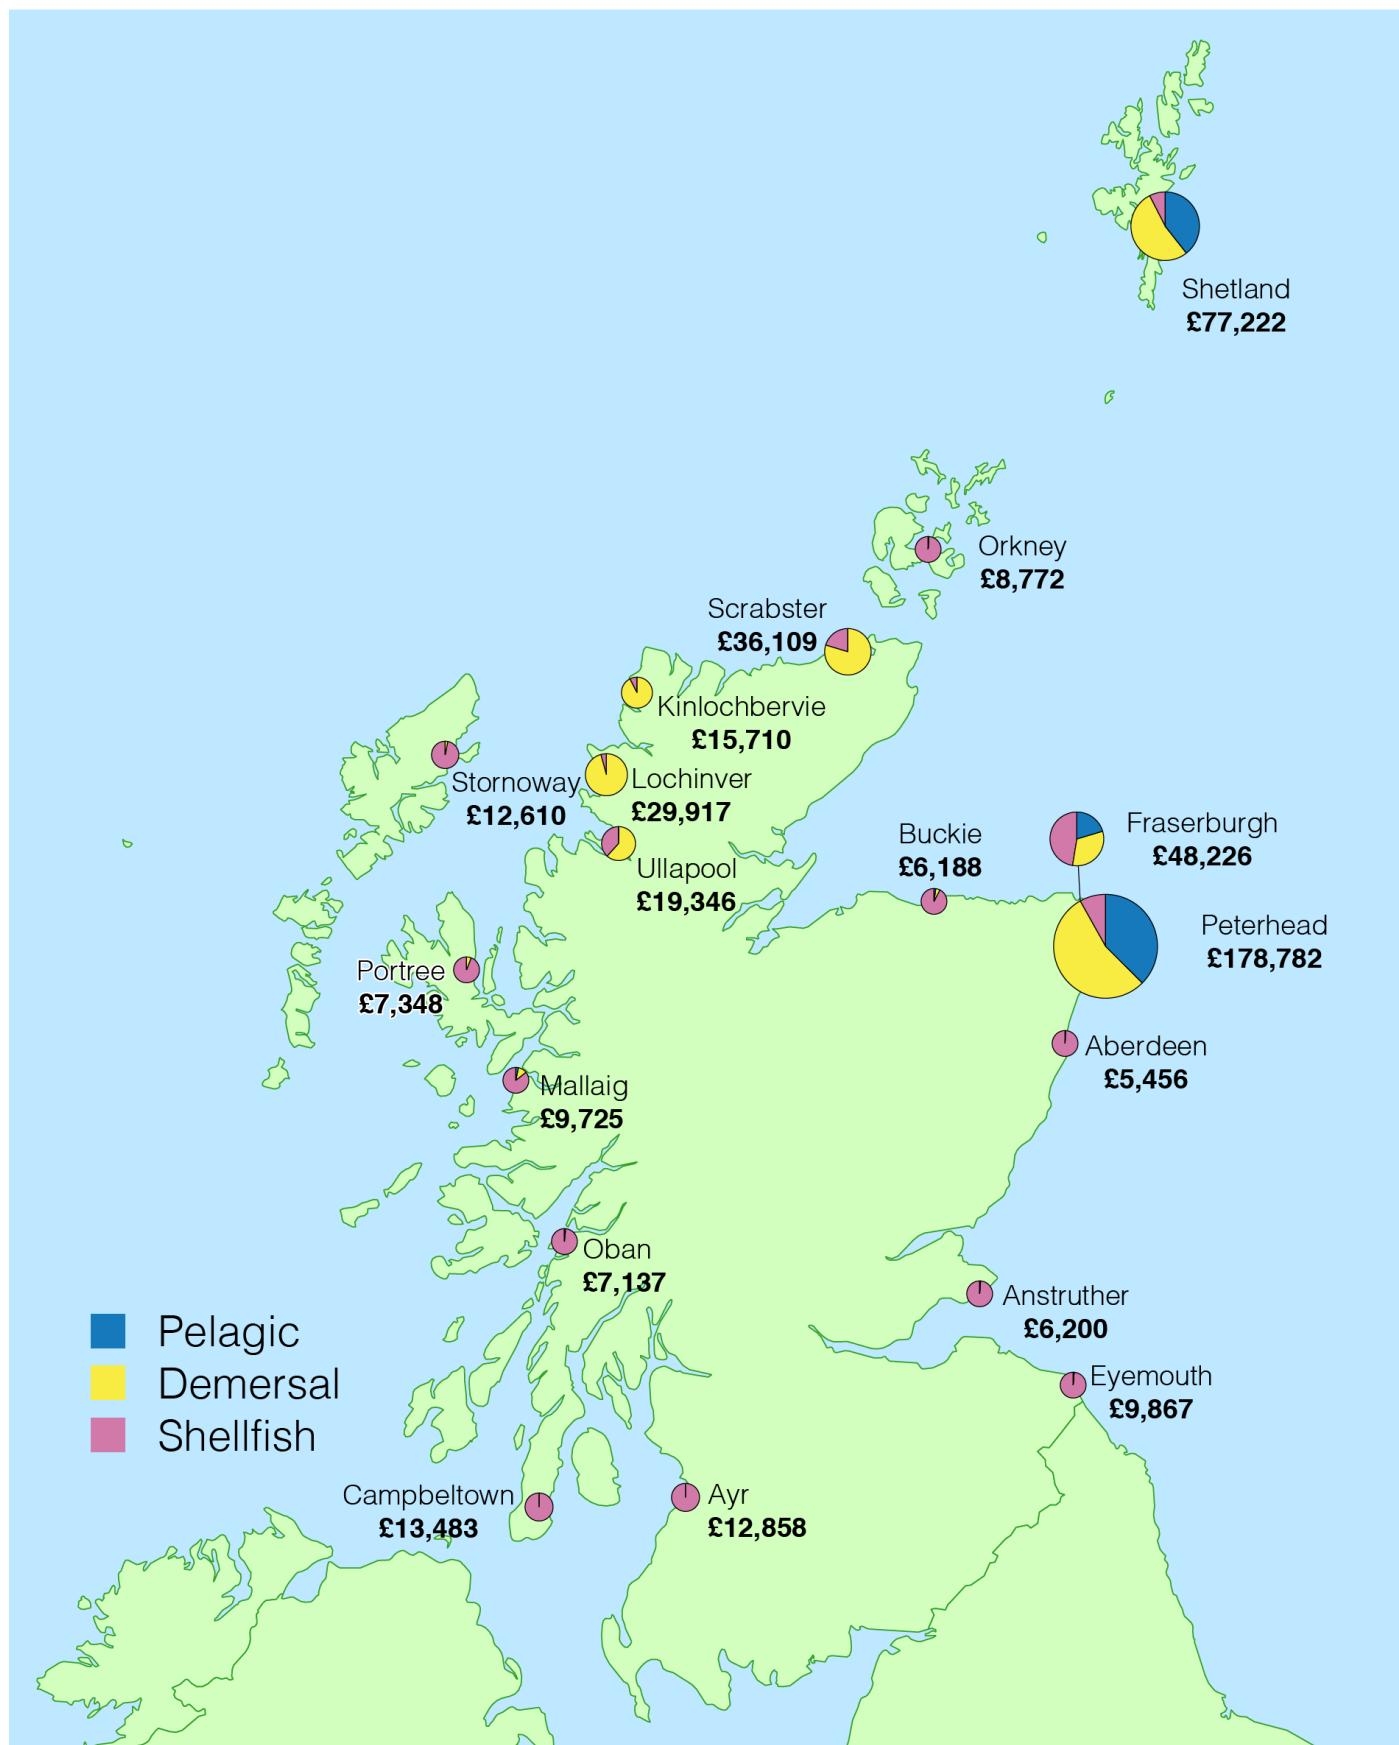

Figure 7. Value of landings into Scotland by all vessels by district by species type (£'thousands), 2017

### 3.5. Total Allowable Catches (TAC) quota and uptake

Total Allowable Catches are limits set at international negotiations for individual fish stocks on an annual basis and represent that maximum of each stock that can be caught. Some stocks are managed and fished only by European Union (EU) member states. The TACs for these stocks are set by the European Commission through internal negotiations between EU member states with an interest. Other stocks are managed and shared with non-EU states, and TACs for these are set at separate negotiations with interested parties, particularly Norway, Iceland, the Faroe Islands and the Russian Federation (the ‘Coastal States’). The EU TAC is shared among EU member states based on a number of factors, including each member state’s past catch record. The amounts corresponding to this share, known as quotas, are shown in Table 33 on page 83 at the UK and at the Scottish Producers Organisations’ (POs) level. Uptake of key commercial quota stocks by tonnage and value landed are presented in Table 34 on page 92.

Chart 9 compares the quota uptake of key quota stocks (with landings by Scottish vessels in excess of £20 million) for Scottish Producer Organisations (POs) over the last five years in the North Sea and West Coast. In general, Scottish POs had high quota uptake in 2017 for key demersal and pelagic species. Only one stock exceeded quota: West of Scotland mackerel at 101 per cent of quota allocation.<sup>2</sup>

For demersal stocks, uptake in the North Sea was generally high, close to 90 per cent across the top demersal species. Uptake of plaice, sole and megrim was lower (21 – 55%). In the West Coast, demersal uptake was slightly lower for each species than the North Sea with 70-80 per cent uptake across the top demersal species. Of the three haddock stocks, two out of three reached 90 per cent uptake, monkfish uptake reached 90 per cent and North Sea cod quota uptake was at 99 per cent.

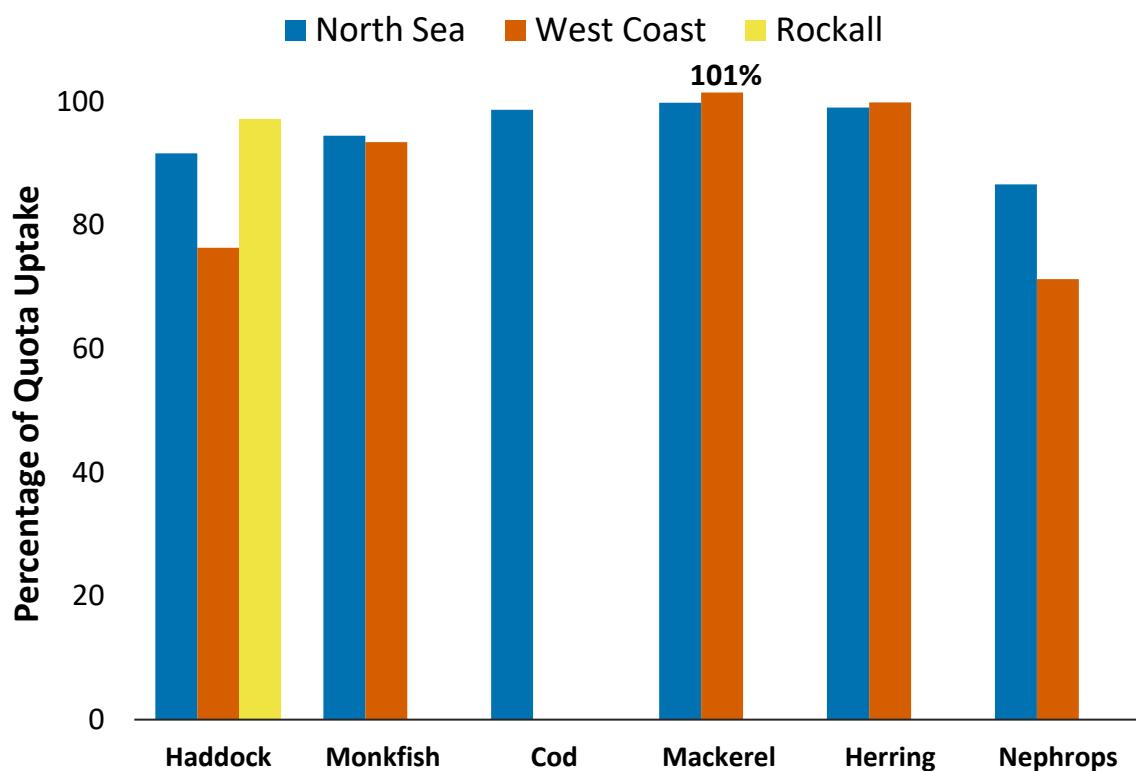

Pelagic species have consistently high quota uptake for both the West Coast and North Sea. This is likely due to the fact that pelagic species shoal together, making it easier for fishers to target particular species. Mackerel quota uptake was 101 per cent for the West Coast and just under 100 per cent for the North Sea. This is seven percentage points down on 2016 for the West Coast and one percentage point down for the North Sea, bringing this stock in line with available quota. For herring, both West Coast and North Sea uptake was just under 100 per cent.

The only shellfish species subject to quota is *Nephrops*. In 2017, Scottish PO quota uptake for North Sea *Nephrops* was 87 per cent, and for West Coast *Nephrops* it was 71 per cent. This represents three percentage points up compared to 2016 for the North Sea and 18 percentage points down for the West Coast.

---

<sup>2</sup> West of Scotland cod and whiting have a nil quota and are managed as a bycatch.

Chart 9. Percentage quota uptakes of key commercial stocks by vessels in Scottish Producer Organisations in 2017

## **4. The Scottish fishing fleet**

### **4.1. Regulation of the UK fleet**

UK fishing vessels are required by law to be registered with the Registry of Shipping and Seamen (RSS), part of the Maritime and Coastguard Agency. Fishing vessels must also have a licence that specifies conditions that must be adhered to. For the purpose of this publication, active vessels are those that are both registered and licenced as at 31<sup>st</sup> December of that year. Scottish based vessels are those registered to a port in Scotland licenced and administered by a Scottish district. UK fishing vessel licences authorise the sea areas in which a vessel can fish and the species of fish that can be caught.

The capacity of fishing vessels in terms of vessel tonnage and power is also controlled through licences. With a finite number of licences in existence and no new licences made available, this places a ceiling on the total number and capacity of vessels in the UK fishing fleet. In order to licence new vessels, fishers must acquire one or more existing licences from other previously licenced vessels.

### **4.2. The Scottish fishing fleet**

The number of active Scottish based vessels has increased to 2,065 vessels in 2017, a two per cent increase (32 vessels) since 2016 and a six per cent decrease (135 vessels) since 2008 (Table 35 on page 93 and Chart 10). The Scottish fleet is dominated by vessels that are ten metres and under in length, with a total of 1,503 vessels falling into this category in 2017, accounting for 73 per cent of the Scottish fleet. 562 vessels are over ten metres in length.

The ten metre and under fleet mostly fish using creels, traps in the form of cages or baskets, typically baited and used to target shellfish species. In 2017, 88 per cent (1,323 vessels) of the 1,503 ten metre and under vessels were fishing using creels. Of the 562 over ten metre vessels, 64 per cent (358 vessels) targeted shellfish, whilst one third (33 per cent) targeted demersal species. Only 20 vessels targeted pelagic species, 17 trawlers and the remaining three - purse seiners. Creel fishing vessels and *Nephrops* trawlers form the majority of the over ten metre shellfish group, whilst trawlers dominate the demersal group (Table 38 on page 96).

Around one quarter of vessels (24 per cent, 505 vessels) in the Scottish fleet are of unknown age. Of those that are known, slightly over half (52 per cent) are at least 20 years or older, with an overall average age of 28 years (Table 36 on page 94 and Chart 11).

Chart 10. Number of Scottish vessels by vessel length and main fishing method  
2008 to 2017

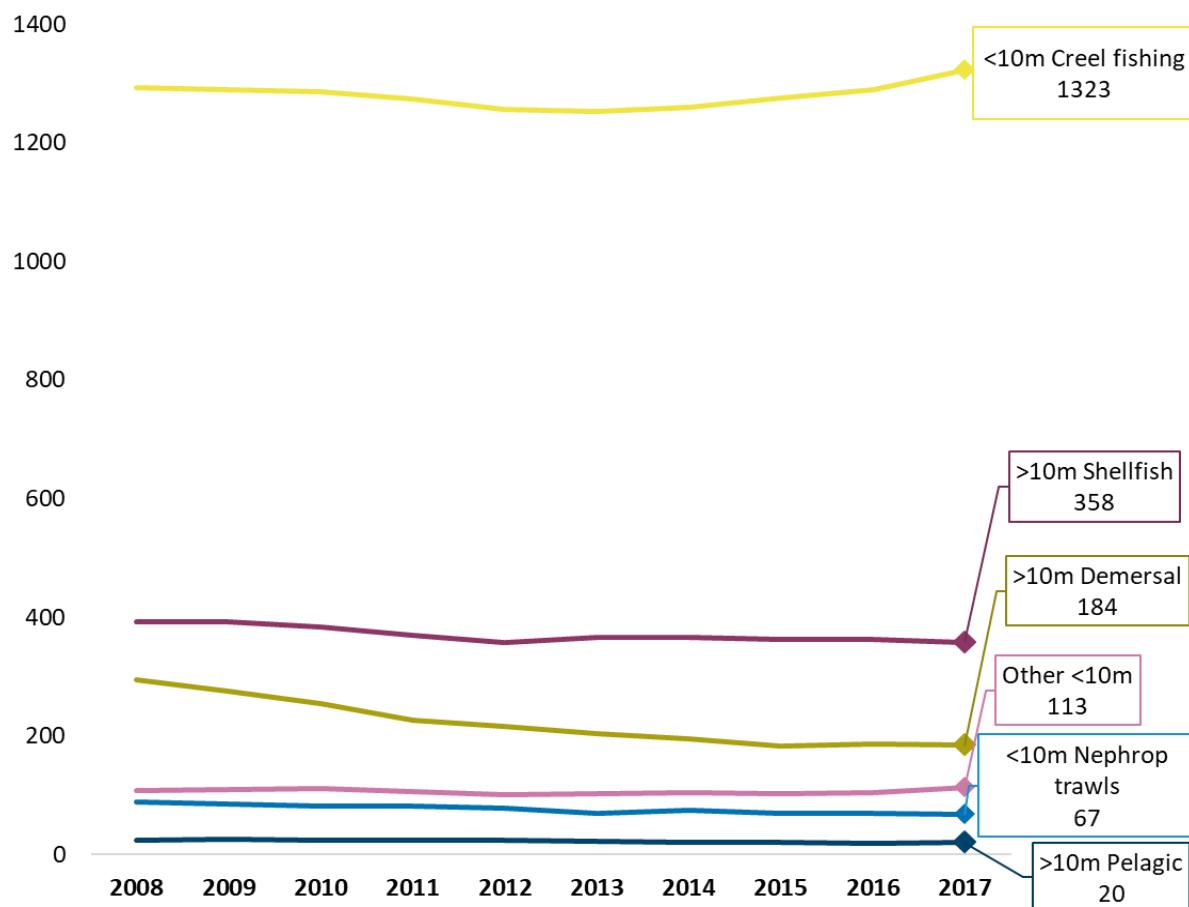

Chart 11. Number of Scottish vessels by age group

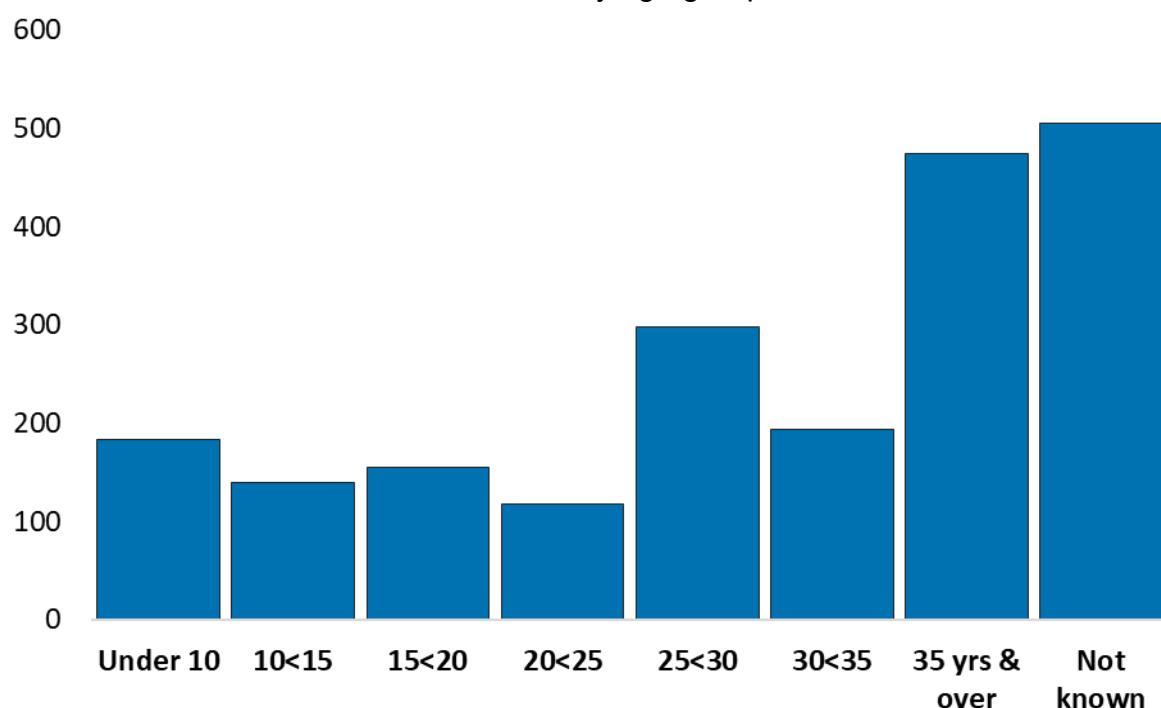

Figure 8 and Table 39 on page 97 show the number of vessels in each of the eighteen administration districts in Scotland (see the map on page 100). Stornoway and Fraserburgh are the two largest districts in terms of vessel numbers with 209 vessels (ten per cent of the Scottish fleet) each in these two districts. 79 per cent of the vessels in the Stornoway district were in the ten metre and under category, whereas for Fraserburgh district this was 54 per cent. Lochinver is the only district to have more over ten metre vessels (63 per cent) than ten metre and under vessels. In the over ten metre fleet, there are more vessels targeting shellfish on the West coast than in the islands or East coast, whereas demersal and pelagic vessels are concentrated on the East coast.

The total engine power of the Scottish fleet has increased slightly to 364 thousand kW, up two per cent since 2016. The total power of the over ten metre fleet increased by two per cent to 282 thousand kW and the total power of the ten metre and under fleet increased three per cent to 82 thousand kW (Chart 12). The average power for the over ten metre fleet was 501 kW per vessel in 2017, whereas the ten metre and under vessels had an average power of 55 kW per vessel.

Compared to 2008, average power has seen little change in both the ten metre and under fleet and the over ten metre fleet, with an increase of four per cent in both fleets. For the ten metre and under fleet, vessel numbers have increased one per cent and total power has increased five per cent between 2008 and 2017. The over ten metre fleet has seen vessel numbers decrease by six per cent since 2008 and total power decrease by 13 per cent.

Chart 12. Scottish vessel engine power by length group 2008 to 2017

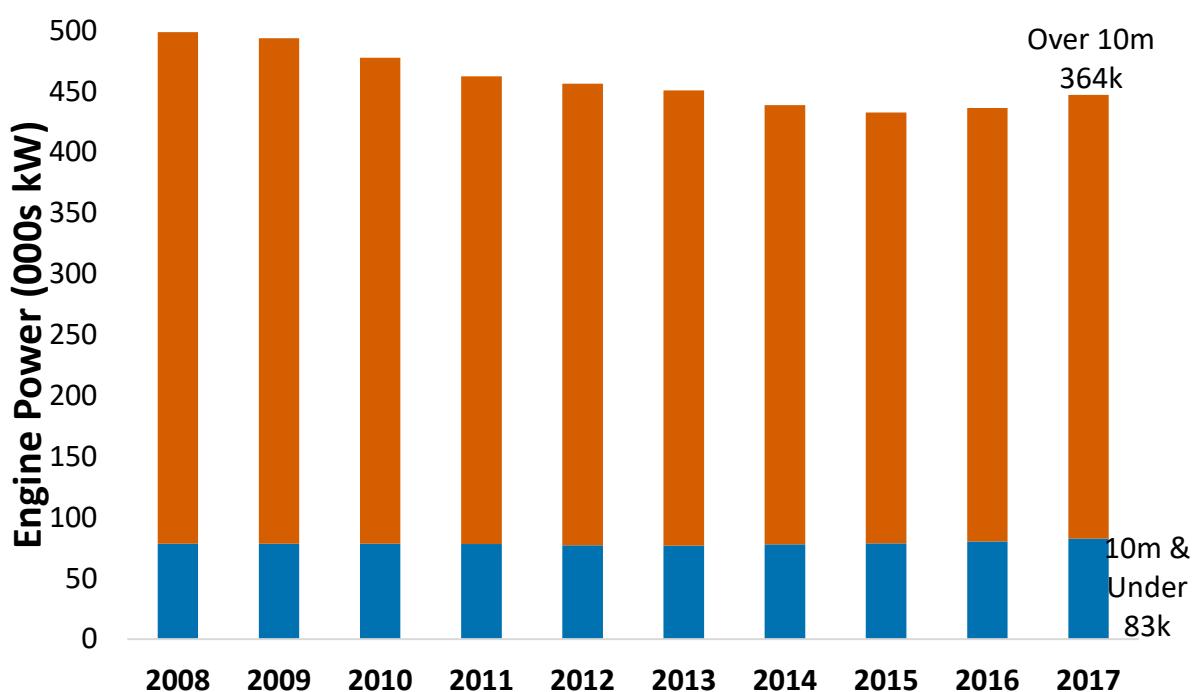

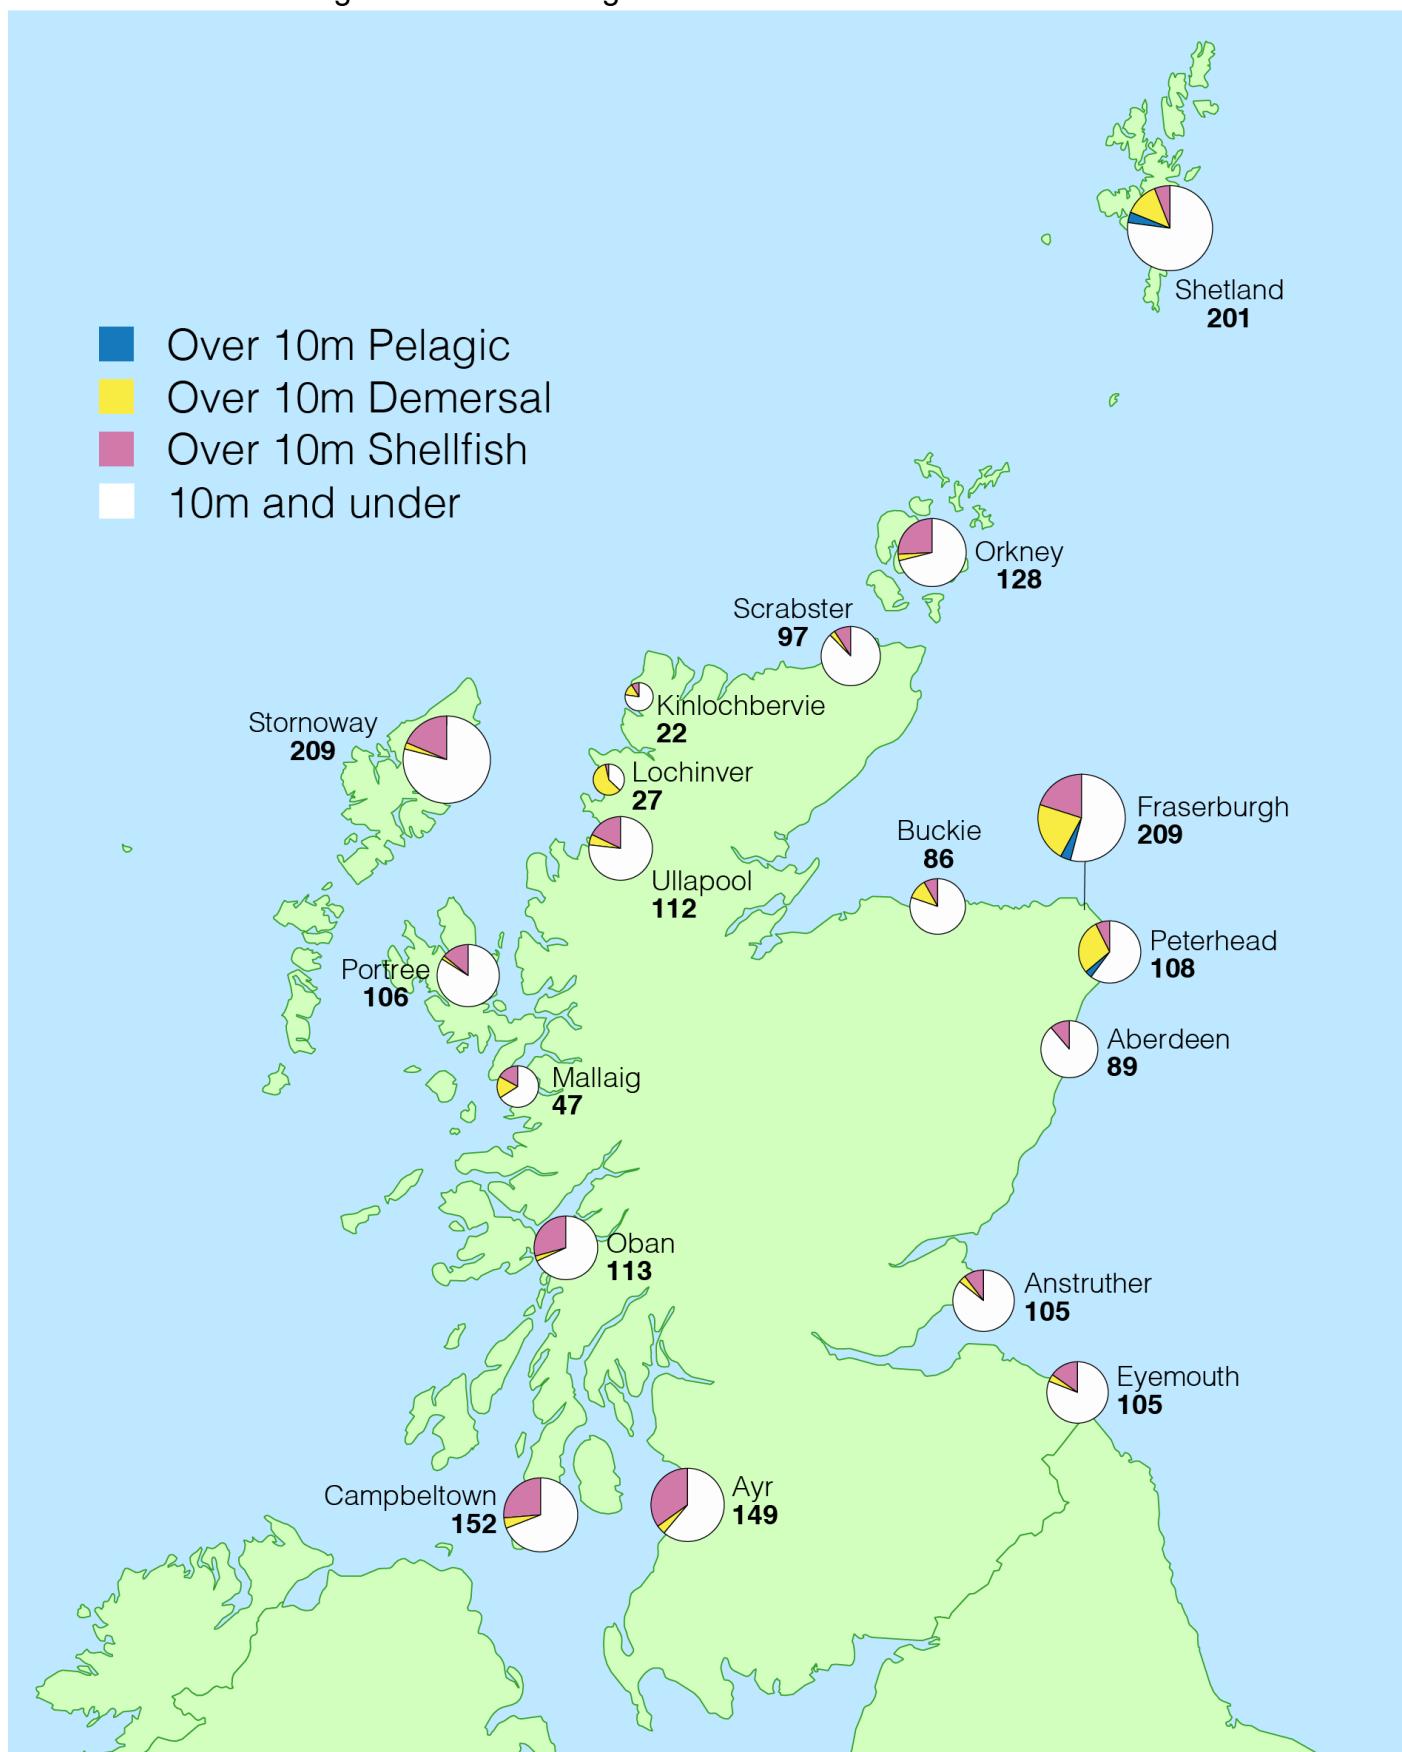

Figure 8. Number of vessels in the Scottish fleet by district by vessel length and main fishing method

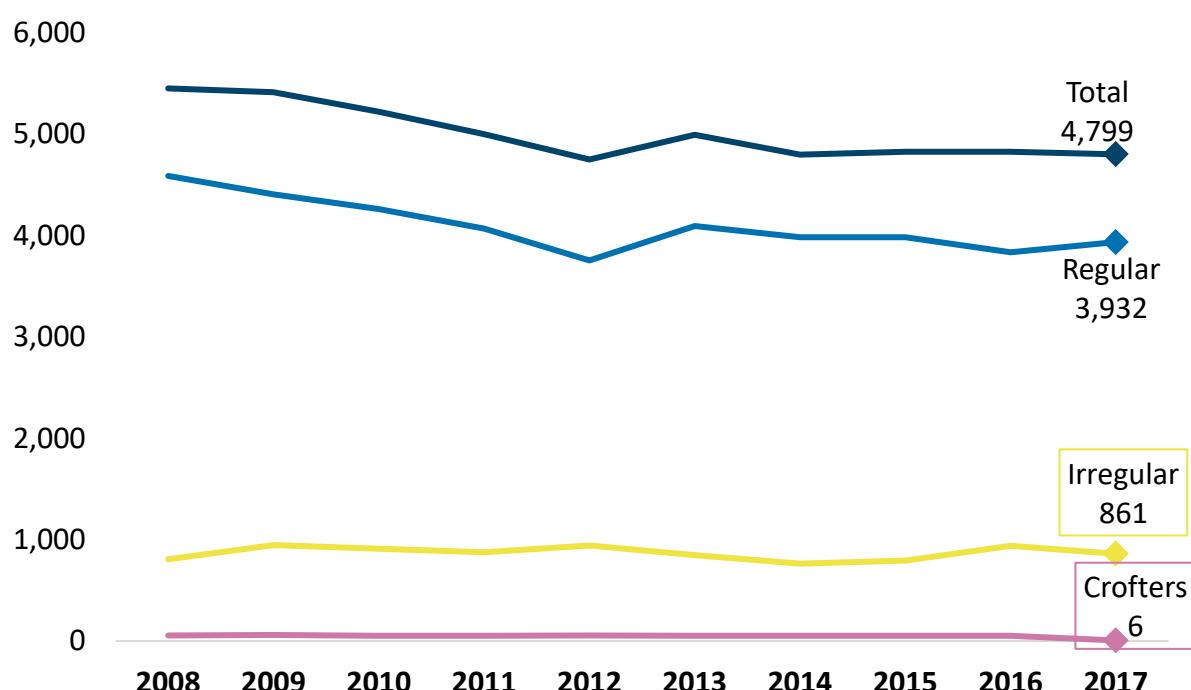

## 5. Employment

In 2017, 4,799 fishers were working on Scottish based vessels, representing 0.2 per cent of the total Scottish labour force. The number of fishers working on Scottish vessels was consistent between 2016 and 2017 with a less than one per cent change (Table 41 on page 98 and Chart 13). In addition to regular and irregular fishers, Scotland has a small number of Crofters who engage in commercial fishing. There were six crofters in 2017 down from 51 (88% change) in 2016. This may reflect difficulty in identifying which fishers are crofters. Since 2008, employment on Scottish based fishing vessels has fallen 12 per cent. This is composed of a 14 per cent decrease in regular employment and an increase of seven per cent in irregular employment.

Fraserburgh is the district with the largest number of fishers (753) accounting for 16 per cent of the total in 2017. It is also the district with the largest number of fishers who work regularly, with 588 regularly employed fishers. Shetland had the most irregular fishers - 202, accounting for 23 per cent of the total fishers in this category. Lochinver and Stornoway were the only districts with crofters.

Overall, employment in fishing accounts for a higher percentage of employment in island communities (Shetland, Orkney and Na h-Eileanan Siar local authorities) and in Argyll and Bute, where it exceeded two per cent each and one per cent, respectively. This highlights the importance of fishing to these communities (Table 43 on page 99).

Chart 13. Number of fishers working on Scottish vessels 2008 to 2017

## **6. Annex 1: Methodology**

### **6.1. Sources**

#### **6.1.1. Fishing Activity and Landings information**

Fishers are legally required to provide information on their fishing activities and what they landed. This includes what they caught, where they caught it, what type of fishing gear they used, and where they landed their catch. The format that fishers or their agents provide the information in to Fisheries Administrations depends on the length of the fishing vessel:

- Vessels over 10 metres are required to maintain logbooks of their fishing activity and provide landings declarations.
  - For UK vessels over 12m, this information must be submitted electronically in an e-logbook system.
  - Vessels between 10m and 12m currently maintain paper logbooks.
- EU legislation does not require vessels 10 metres and under to keep logbooks, but in Scotland, these vessels are required to provide equivalent information on FISH1 forms.

#### **6.1.2. Value of Landings**

Legislation requires that buyers and sellers of fish have to be registered and have to supply Fisheries Administrations with sales notes. These sales notes can be in paper or electronic format and show what was paid for the fish being sold. With sales of fish into non-EU countries, it can take a long time for sales notes to be submitted. If a sales note for a given landing is not available, then the average price for that species of fish is used instead.

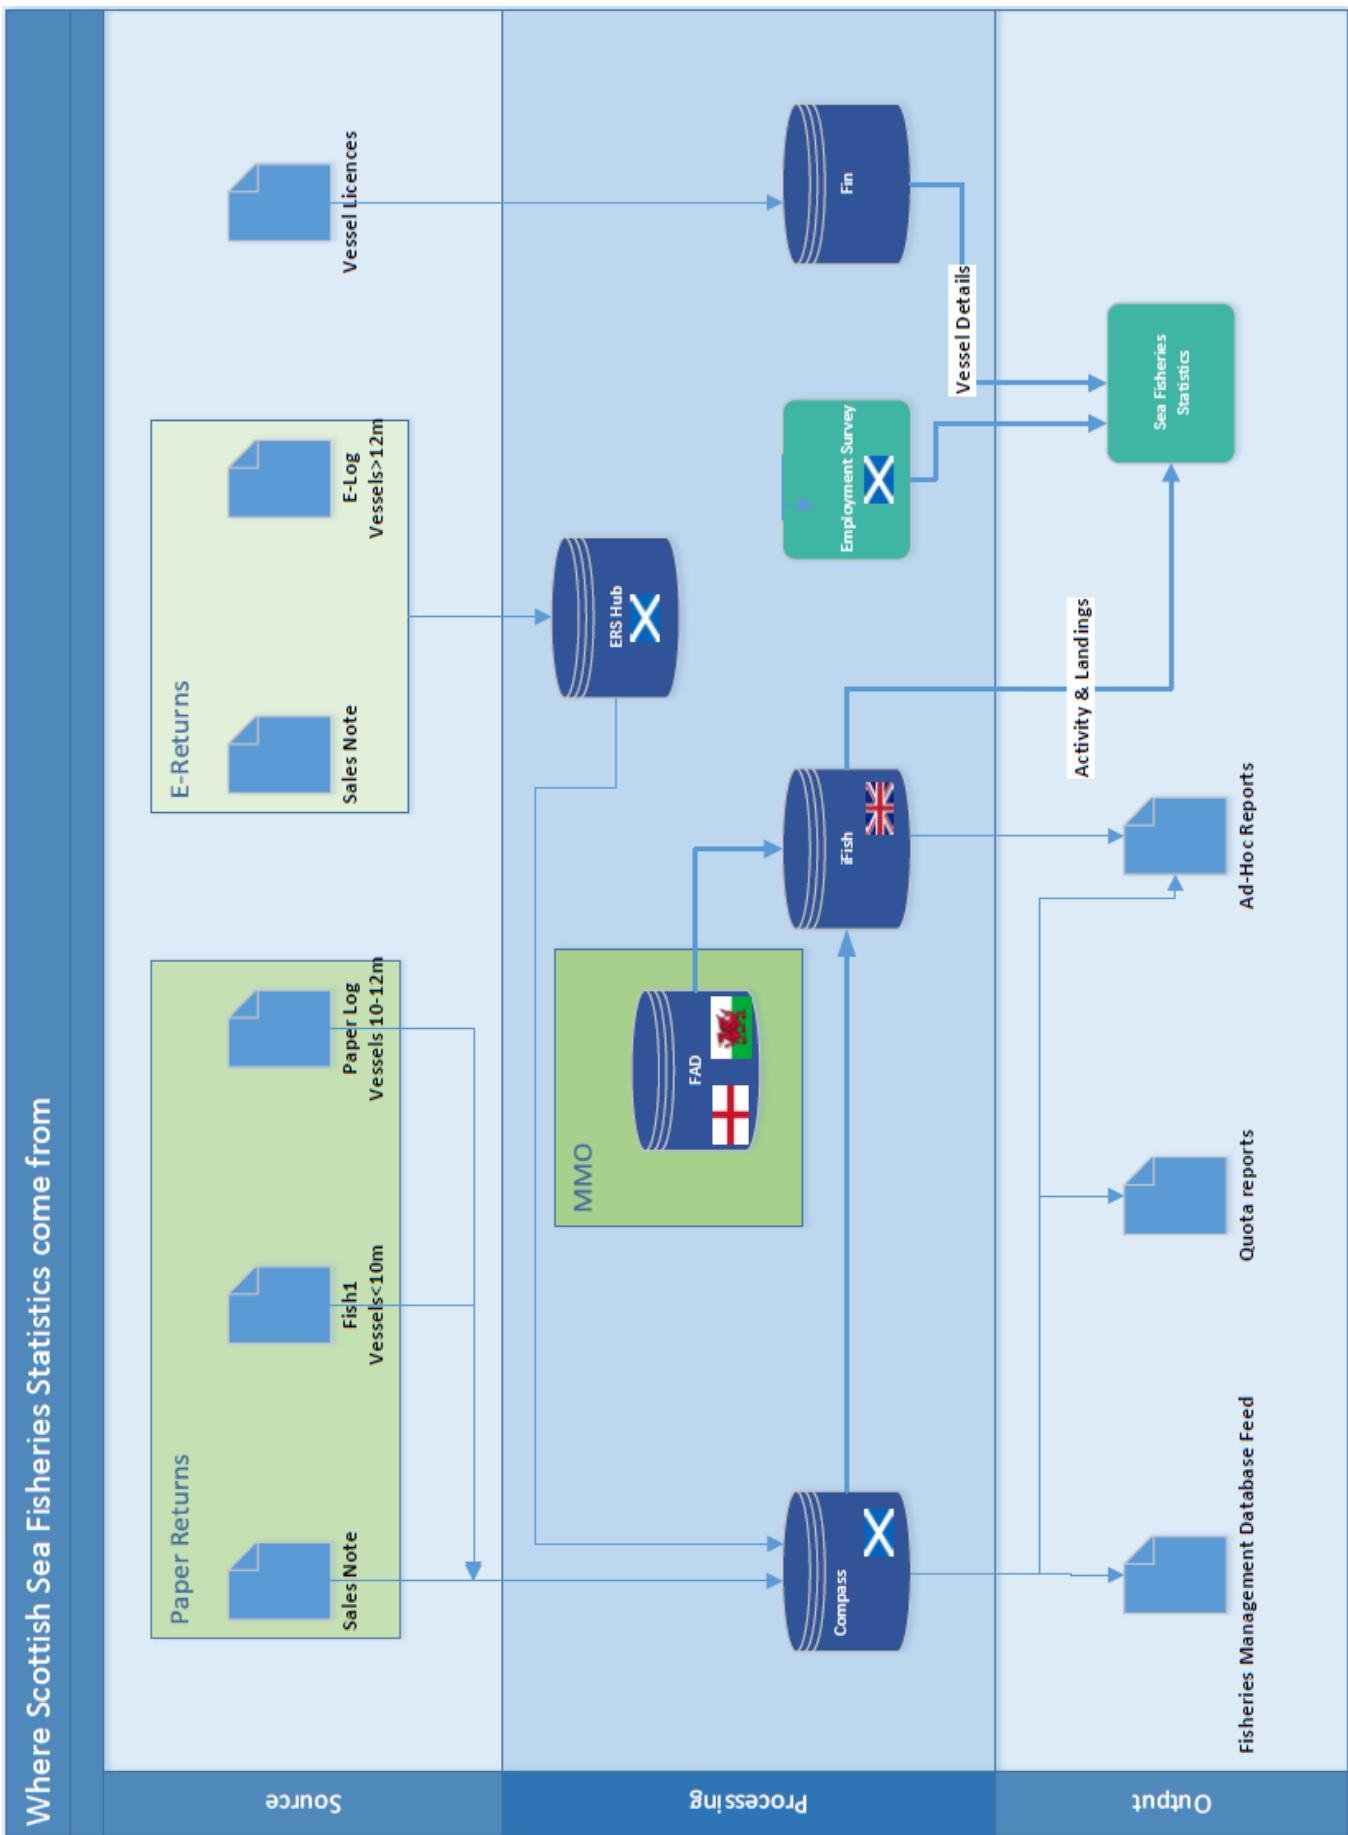

#### **6.1.3. Vessel Information**

Fishers have to apply for a licence to be allowed to fish and UK Fisheries Administrations keep a record of every vessel that has a licence. This information includes the vessel's length, engine power, gross tonnage, age of the vessel, the port where it is registered to, and its main fishing method.

#### **6.1.4. Employment**

Information on employment in the Scottish fishing fleet is gathered by Marine Scotland (MS) through a fisher employment survey distributed to port offices in each of the 18 Scottish port districts. MS Compliance Fisheries Officers complete the survey using their expert local knowledge of the fishers in their district. In tables 2.8 and 2.10, this information is put into context of the total employment in Scotland using data on the Scottish labour force obtained from the Annual Population Survey by the Office of National Statistics.

## Where Scottish Sea Fisheries Statistics come from

## **6.2. Data Processing**

Marine Scotland maintains a database called Compass that contains all of the sea fisheries data described above, except employment, for all Scottish vessels' landings anywhere in the world plus all foreign vessels' landings into Scotland. The information from paper logbooks and FISH1 forms is entered into the Compass database by MS Compliance Fisheries Officers. The information from e-logbooks is processed and checked electronically before being imported into Compass.

The data from the Scottish Compass database are then imported into the UK-wide data warehouse called IFISH. IFISH adds the data from all the UK Fisheries Administrations together into one database. This is where most of the data presented here in Scottish Sea Fisheries Statistics comes from. Currently, vessel information comes from the older Scottish Fisheries Information Network (FIN) database, which is being replaced by the newer database Compass. In future publications, Compass will completely replace FIN. [switchover, responsibility for data]

For producing this publication, the Marine Analytical Unit (MAU) in MS take a frozen 'cut' of data from IFISH and FIN (for vessel information only) for the previous five calendar years at the end of July. The data are then quality assured for publication (see the Quality section below).

## **6.3. Outputs and Publications**

The Compass and IFISH databases are the sources of data for a range of different outputs and publications. As administrative data, the primary use of the data is to enforce the law on sea fisheries protection by UK Fisheries Administrations. In Scotland this is carried out by Marine Scotland Compliance. The data are also used to: monitor fishing quota uptake by each Fish Producer Organisation (FPO) on a weekly basis, to supply MS Science with fisheries data for marine science, to produce analysis and evidence to inform government policy and decision-making, to include the fishing industry in economic indicators, to inform the National Performance Framework indicators on the marine environment, assist in marine planning decisions and to answer external requests for data. External requests are often received from academics, environmental groups, the fishing industry, consultants on offshore developments, or people interested in information on their local community's fishing industry. The Marine Management Organisation and MS Science use Scottish data as part of their submissions to the EU Commission and the International Council for the Exploration of the Sea (ICES) to monitor the fishing industry and provide scientific advice on maintaining sustainable fisheries.

## **6.4. Quality**

As National Statistics, this publication has been assessed by the UK Statistics Authority as being of the highest standards of trustworthiness, quality and value. Data quality is assured throughout the publication process from sources to final outputs.

Sea fisheries data in this publication come from administrative databases where the primary purpose of collecting the data is for sea fisheries protection. The Marine Analytical Unit (MAU) uses the data for the secondary purpose of producing this statistical publication. As administrative data gathered under legislation for law enforcement, the data form a census (a complete dataset) that records every voyage and landing by UK fishing vessels or by any vessel landing into the UK. MS Compliance assesses that Illegal, Unreported and Undeclared (IUU) fishing (sometimes called “black landings”) as being very low with minimal impact on the trends shown in the data.

When a fisher, agent or Fisheries Officer submits data to the database, there are automatic checks for logical inconsistencies, such as wrong combinations of ICES rectangle and sea area. When data is copied from the Scottish database Compass into the UK-wide data warehouse IFISH, there are more automatic checks to make sure the data are correct and that the data copy over correctly between the different databases. In completing the forms, fishers and agents choose from drop-down menus, which help to minimise data entry error.

As MS Compliance use the data throughout the year for sea fisheries protection, the data are checked on an ongoing basis. If MS Compliance find errors in the data, they can request that fishers or agents supply correct data and amend the records. MS Fisheries Officers are experts on data reporting and the fishers in their port district, ensuring data quality when they enter FISH1 and paper logbook data and in finding and amending any data errors.

The MAU also use the data throughout the year for producing reports on landings of quota fish for the Fish Producer Organisations (FPOs), for scientists in MS Science, and for internal and external queries. Expert users of the data, like the FPOs, give regular feedback on consistency between MAU's reports and their own internal records, providing a robust external check on data accuracy, at least for quota species that are the majority of fish landings. The Marine Management Organisation (MMO) use the UK data warehouse IFISH for their own work throughout the year, providing another expert check on data quality.

The MAU undertakes multiple checks on the data before publication. The data are checked against the provisional publication for the same year and against the final statistics for the previous year and large changes or inconsistencies are investigated further. The same programs to query the database are run each year for consistency. Data between the Scottish database and UK-wide database are compared to ensure the data have been copied over correctly. High tonnage or high value landings are investigated for accuracy and very high or low prices for sales involving one tonne or more of fish are investigated further. When errors are identified, they are sent to MS Compliance Fisheries Officers in the relevant port district for correction. MAU quality assures the results before MS policy colleagues provide further sense checks based on their expert knowledge of the industry.

## 6.5. Limitations of the data

Due to the legal basis for collecting sea fisheries data, the quality of the data is high and forms a census, or complete record. Some limitations of the data include timeliness, lack of data on foreign vessels in UK waters or Scottish vessels operating far from Europe and limits on the precision of marine geography.

Information on landings of fish species not subject to quota, or fish landed by UK vessels abroad, can often take months for the information to be supplied. This is why provisional statistics are not published until 4-5 months after each year end and the final statistics are published at the end of September. The MAU assessed that approximately 0.2% of landings (by value) of Scottish vessels' landings are omitted from the final published statistics each year due to delays in receipt of information on landings outwith the UK. However, this small incompleteness does not affect the overall trends shown by the statistics.

The data in the UK data warehouse IFISH are a complete record of all UK vessels' voyages and landings and of all foreign vessels' landings *into the UK*, but the UK does not have a system for recording foreign vessels' catches from UK waters if they land their catch abroad. That is because the legal responsibility for recording details of that vessel and its activities lies with its own country. Similarly, sales notes are generally not supplied by a small number of Scottish-registered vessels operating far from Europe (sometimes called the far-water/distant-water fleet). As there are little data on prices of exotic species landed outside of Europe, prices are estimates only. This only affects a very small amount of the overall tonnage and value of landings.

A small number of records will be identified as erroneous but will not be amended immediately. This is because they serve as a legal record of what fishers and agents supplied to MS Compliance under sea fisheries protection law. If MS Compliance takes enforcement action, then known errors may not be able to be amended until the case is resolved. This affects a very small number of records so the impact on published figures and trends is minimal.

Some data presented in this publication by a specified geography – such as by local authority or ICES Area of fish capture – are limited by the complexity of marine geography. Data on area of capture are not available below the level of an ICES rectangle, a 30 nautical mile by 30 nautical mile area, and the data do not report whether fishing occurred in inshore or offshore areas. When considering terrestrial geographies such as local authorities or port districts, there is often a mismatch between these and marine geographies such as Scottish Marine Regions or ICES Rectangles.

### 6.5.1. Change in recorded landings by Scottish vessels since provisional statistics

The time lag between sales and the provision of sales notes can cause changes between provisional and final statistics for a given year. Value of landings information is derived from Sales Notes, which are submitted by Registered Buyers and Sellers. This information is matched up with the landing declaration submitted by

the vessel to obtain values for each landing. If there is no Sales Note, for example when a UK vessel lands into a non-EU country, the value of the landing is estimated. The most accurate estimation is based on the average price for the same species in the same quarter of the previous year. If that method is not available, the database uses the next most accurate method based on the price for the same species in the previous quarter, and then opens up to the same species type, and so on. When a sales note is supplied for that landing, the estimates are replaced by the true figure from the sales note.

#### 6.5.2. Revisions to previous years' final statistics

The landings tables present data for the past five years. Previous years' data are updated to ensure users have access to the latest data available. Revisions are typically small and affect landings information where data comes from logbooks, landing declarations and sales notes that can be amended for small changes (usually in the order of 0.2%) due to late data entry or rectification of errors. As these do not affect the main trends presented, they are not highlighted and not footnoted. Data older than five years is not updated.

The list of the main species displayed within the landings tables may also change each year as the criterion for a species being a 'main species' is that the total value landed into the UK or by UK vessels is £2 million or more.

On the rare occasions that revisions are required in the previously published figures that *do* affect the main trends presented, the revised figures are marked "(r)" and suitably footnoted to explain the reason for the revision. The statistics are revised between the provisional statistics and final statistics – see above. However, provisional statistics are always explicitly identified as such.

#### 6.5.3. Comparability with other countries' statistics

EU legislation covers information requirements for vessels over 10 metres and for all buyers and sellers, which means that data is comparable for all countries within the UK and for all EU countries. The main difference between information collated in Scotland and that collated in the rest of the UK is that, through the FISH1 returns, Scotland obtains equivalent information on a full coverage basis for vessels of 10 metres and under. In the rest of the UK, this information is provided on a sample basis only. However, the vast majority of fish are caught by vessels over 10 metres, so the information is effectively comparable for all UK countries for most species.

The method for counting Scottish registered vessels is by totalling the number of active vessels registered in Scottish ports on 31<sup>st</sup> December of each year. In comparison, in the rest of the UK vessels are counted if they are registered (regardless of whether they are classed as active or not). This can lead to slight discrepancies between figures published at the Scottish level and those published at the UK level.

## 7. Annex 2: Glossary of terms

**Active Vessel** is a fishing vessel that is registered and licenced to fish and marked as ‘active’ in our database. Fishers can request to be marked as ‘inactive’ if they do not intend to do any fishing. However, this does not mean that all vessels marked ‘active’ do any fishing in a given year.

**Administration Port** is a vessel’s ‘home’, the port that is responsible for administration of the vessel, including its licence. This publication gives details of vessels and landings down to the level of port districts, or groups of ports that have one Marine Scotland office to administer the ports in that district.

**Crofters** are people who hold small plots of lands called crofts and usually engage in small-scale subsistence farming and other occupations.

**Demersal** fish live close to the seabed e.g. cod, haddock, monkfish. *Pelagic* fish live close to the surface.

**e-Log** or electronic logbooks are mandatory for vessels of 12m long or over. A fisher has to record their fishing activity in a logbook and submit it to their fisheries administration.

**Engine Power** is a measure of the power of a fishing vessel’s engine in kilowatts (kW). Where an engine has been permanently de-rated and this has been declared to the Register of Shipping and Seamen(RSS), this is the de-rated engine power; otherwise, it is the maximum continuous engine power (MCEP) declared to the RSS. Where neither of these is available, the registered engine power is used.

**FISH1 forms** are similar to logbooks, but for ten metre and under vessels. Under Scottish legislation, these vessels have to submit electronic or paper FISH1 forms to Marine Scotland offices for entry onto the database. As the other parts of the UK do not have legislation that enforces this, other Fisheries Administrations in the UK provide statistics on 10m and under vessels on a sample instead of full coverage basis.

**Fishers Employed** is defined as people working at sea on a commercial fishing vessel, classified as “Regular” or “Irregular” according to whether commercial fishing is their main occupation or not. Crofters who gain some part of their living from fishing are included in the tables.

**Fishing Areas** are defined by an international convention. The immediate waters around the UK are subdivided into ICES Sub-areas: IV (North Sea), VI (West of Scotland) and VII. VII is further divided into Western Approaches, VIIg,h; the Irish Sea, VIIa; and the English Channel, VIId,e. Each fishing area is also broken down into ICES rectangles. ICES areas are shown on the map on page

**Fish Producer Organisations** (POs) are institutions set up in accordance with EC regulations to improve the market for their members' catches. POs may also be

granted responsibility by Fisheries Administrations for the management of fish quotas in addition to this function.

**Gross Tonnage** is a volumetric measurement of vessel capacity, or the amount of space inside the vessel, under the rules of the ITC69 (International Tonnage Convention).

**ICES** or the International Council for the Exploration of the Sea coordinates and promotes marine research on oceanography, the marine environment, the marine ecosystem, and on living marine resources in the North Atlantic. They provide impartial scientific advice on setting fishing quotas.

**ICES Rectangles** are areas of the sea defined by ICES (see above) that are 30 nautical miles by 30 nautical miles. They have codes based on a grid reference e.g. '41E7'. A set of rectangles come together to form an ICES fishing area e.g. IVa Northern North Sea (see fishing areas above).

The landings data in this publication and data on fishing effort are also available by individual ICES rectangles in Scottish waters on the Scottish Government website.

**Inshore fishing** is within 12 nautical miles (nm) of the coast. Only the vessels registered to that country can fish within that area. Between 12 and 200 nm, called the offshore zone, all European Union member state vessels can fish in any EU member state's waters.

**Landing Declarations** provide information on the species, weight and presentation of landed fish. Under EU legislation, Scottish vessels landing into the UK are required to submit their log sheets to the authorities within 48 hours of landing for paper logbooks or 24 hours if provided electronically. Scottish vessels landing abroad are required to dispatch copies of their landings declaration to the vessels home port within 48 hours for paper logs or 24 hours for electronic submissions.

**Live Weight Equivalent** is the weight of fish when first removed from the water before it is processed aboard the vessel (for example by gutting). This is calculated by using a standard conversion factor based on the species and the presentation of the fish when it is landed. The conversion factors are worked out by scientific research.

**Logbook** entries provide details on fishing activities and voyages. Logbooks also detail the fishing gear used and net mesh size. The locations of fishing are recorded in logbooks by ICES statistical rectangles and areas. Catch information for each fishing operation include details of the species caught. Scottish vessels landing into the UK are required to submit their log sheets to the UK authorities within 24 hours of landing, while those that land at foreign ports must dispatch copies of their log sheets to the vessels administration port within 24 hours.

**Main Fishing Method** refers to the most common method of fishing a vessel intends to use, as specified by the vessel owner on their licence application. The actual fishing gear used by the vessel in any one activity may not be the same as that for the declared main fishing method.

**Marine Scotland** is a Fisheries Administration that enforces sea fisheries protection via MS Compliance and manages Scotland's seas.

**Nephrops** (*Nephrops norvegicus*) are also known as Norway lobster, langoustine, Dublin Bay prawns or scampi. Not to be confused with other species that can also commonly be called 'prawns'.

**Pelagic** species are found mainly in shoals in midwater or near the surface of the sea e.g. herring and mackerel. **Demersal** species live near the seabed.

**Port Districts** are collections of individual ports that come together to form one unit for fisheries administration. Each port district is responsible for managing the vessels, fisheries and data reporting in their area. In Scotland, there are eighteen port districts (see the map on page 100).

**Quota Fish** are species that subject to international quotas. Quotas are the tonnage of fish of different species that may be legally landed from defined sea areas by individual countries. The U.K. Quotas are divided up and allocated to Fish Producer Organisations according to the number of Fixed Quota Allocation units held by the Producer Organisation and their member vessels. National quotas are negotiated as a share of the Total Allowable Catch (see below).

**Register of Buyers and Sellers** is a scheme of registration for Buyers and Sellers of first sale of fish and designation of fish auction sites. This requires Registered Buyers and Sellers to submit sales notes that show the details of the fish being bought and the price paid for it. Sales notes should be submitted within 24 hours of sale by the registered buyer of the fish, except at designated auction sites where the seller has the responsibility for submitting sale notes. Registered Buyers and Sellers with an annual turnover of €200,000 in first sale of fish are required to submit their sales notes electronically. See [www.fishregister.gov.uk](http://www.fishregister.gov.uk)

**Seining** is a method for catching fish where the net is set on very long ropes designed to herd or contain the fish into the middle of the net. After the fish have been surrounded by the net, it is slowly hauled back to the vessel.

**Shellfish** in this publication covers all crustaceans, molluscs and cephalopods (like octopus).

**Total Allowable Catch (T.A.C.)** is the maximum permitted tonnage of a given species in a defined area that can be caught. TACs are set at the December Council negotiations between the EU Member States and other Coastal States (Norway, Faroe Islands, Russia, and Iceland).

**Trawling** may be used for either bottom dwelling (demersal) or mid-water (pelagic) species, the net being of a basic funnel-shaped construction and towed behind a vessel or between two vessels (pair trawling).

## **8. Annex 3: Further Information**

Other official publications on sea fisheries statistics include:

### **Marine Scotland**

Scottish Sea Fisheries Statistics (this publication) is also available online:  
[www.gov.scot/Topics/Statistics/Browse/Agriculture-Fisheries/PubFisheries](https://www.gov.scot/Topics/Statistics/Browse/Agriculture-Fisheries/PubFisheries)

Marine Scotland also publishes summary provisional statistics each year.  
<https://www.gov.scot/Topics/Statistics/Browse/Agriculture-Fisheries/provisionalfishstats>

Quota reports issued weekly to Scottish Fish Producer Organisations are available online.

<https://www.gov.scot/Topics/marine/Sea-Fisheries/management/17681/ScottishWeeklyQuotaUptake>

The landings and effort data in this publication are also available by ICES rectangle (sea areas) around Scotland.

<https://www.gov.scot/Topics/Statistics/Browse/Agriculture-Fisheries/RectangleData>

Fisheries data is also available at the level of individual ICES rectangles in Scottish waters on National Marine Plan interactive (NMPi).

<https://marinescotland.atkinsgeospatial.com/nmpi/>

### **Marine Management Organisation (MMO), Department for Environment, Food and Rural Affairs (Defra)**

UK Sea Fisheries Statistics is a comprehensive collection of statistics on the UK fishing industry, published annually.

[www.gov.uk/government/collections/uk-sea-fisheries-annual-statistics](https://www.gov.uk/government/collections/uk-sea-fisheries-annual-statistics)

The UK Vessel List of registered and licenced vessels of over 10 metres length, published monthly.

[www.gov.uk/government/collections/uk-vessel-lists](https://www.gov.uk/government/collections/uk-vessel-lists)

Monthly UK Sea Fisheries Statistics is a summary publication of landings into the UK, published monthly.

[www.gov.uk/government/collections/monthly-uk-sea-fisheries-statistics](https://www.gov.uk/government/collections/monthly-uk-sea-fisheries-statistics)

### **Food and Agriculture Organization of the United Nations (FAO)**

FAO Yearbook of Fishery and Aquaculture Statistics, published annually with data relating to two years prior.

[www.fao.org/fishery/publications/yearbooks/en](https://www.fao.org/fishery/publications/yearbooks/en)

### **Eurostat**

Fishery statistics from the European Union official statistics producer. It includes data from some non-EU countries for comparison.

[http://ec.europa.eu/eurostat/statistics-explained/index.php/Fishery\\_statistics](http://ec.europa.eu/eurostat/statistics-explained/index.php/Fishery_statistics)

## **9. Annex 4: Landings and Vessel Tables**

This section presents full tables of statistics on landings, the Scottish fishing fleet and employment.

Landings and effort data are available at the level of individual ICES rectangles online on the Scottish Government website and NMPi (see above).

Table 1.

Tonnage and value of landings by Scottish vessels into Scotland  
by main species 2013 to 2017

	Tonnage					Value (£'000)				
	2013	2014	2015	2016	2017	2013	2014	2015	2016	2017
Bass	2	1	0	0	0	11	5	3	2	1
Black scabbardfish	57	112	127	96	101	105	150	161	128	152
Brill	4	4	5	5	5	20	15	24	22	25
Cod	10,501	10,698	11,273	12,841	14,496	20,729	21,581	22,170	26,951	33,631

(a) Other species include pelagic and/or shellfish species

(1) Main species are those where the total value landed by Scottish vessels was £2m or over in 2017.

(2) Bottom trawl gears catching demersal species have been included as demersal trawls, while bottom trawl gears catching *nephrops* have been included as *nephrops* trawls.

		Torridon	

\* FO demarks the location of fishery offices, the administration base for each district.

## A NATIONAL STATISTICS PUBLICATION FOR SCOTLAND

The United Kingdom Statistics Authority has designated these statistics as National Statistics, in accordance with the Statistics and Registration Service Act (2007) and signifying compliance with the Code of Practice for Official Statistics.

Designation can be interpreted to mean that the statistics: meet identified user needs; are produced, managed and disseminated to high standards; and are explained well.

### **Correspondence and enquiries**

For enquiries about this publication please contact:

Cameron Melvin  
Marine Analytical Unit  
Telephone: 0131 244 4414  
Email: c.melvin@gov.scot

For general enquiries about Scottish Government statistics please contact:

Office of the Chief Statistician  
Telephone: 0131 244 0442,  
Email: Statistics.enquiries@gov.scot

### **How to access background or source data**

The data collected for this statistical bulletin are available via the Scottish Government Sea Fisheries Statistics website. Data are available at the level of ICES statistical rectangles on the ICES rectangle webpage or alternatively on National Marine Plan interactive.

You can also request sea fisheries data or queries on this publication to the email address and telephone number listed above.

### **Complaints and suggestions**

If you are not satisfied with our service or have any comments or suggestions, please write to the Chief Statistician, 3WR, St Andrews House, Edinburgh, EH1 3DG, Telephone: 0131 244 0302 Email: Statistics.enquiries@gov.scot

If you would like to be consulted about statistical collections or receive notification of publications, please register your interest at [www.gov.scot/scotstat](http://www.gov.scot/scotstat)  
Details of forthcoming publications can be found at [www.gov.scot/Statistics](http://www.gov.scot/Statistics)
