1. Background

The [Community Justice \(Scotland\) Act 2016](#) (the Act) provides the legislative framework for the model of community justice.

As part of that model, s17 of the Act requires the Scottish Ministers to publish a performance framework, setting out nationally determined outcomes which are to be achieved in each local authority area, and national indicators which are to be used in measuring performance against these.

A revised version of the performance framework (referred to as the Community Justice Performance Framework (CJPF)) was published under s18(4)(a) of the Act. The CJPF supersedes the version (referred to as the Outcomes, Performance and Improvement Framework (OPIF)) that was published in 2016.

This revised document accompanies the CJPF and provides information on how to use the nationally determined outcomes and national indicators. In particular, it describes the source of the data underlying each national indicator, sets out how this data will be supplied to local areas, and provides additional technical notes. Guidance on reporting periods is also provided and updated technical notes for each nationally determined outcomes are included in [Annex B](#).

This document is primarily for statutory community justice partners acting jointly at a local level (referred to as 'community justice partnerships'). This document is published by the Scottish Government and is kept under review and updated as necessary.

In addition to this document, statutory guidance to support statutory community justice partners to understand their roles arising from the Act (as per s24 of the Act), in relation to local planning and reporting, is also published by the Scottish Government and is kept under review and updated as necessary.

2. Guidance on reporting periods

Community justice partnerships (CJPs) should use the nationally determined outcomes and national indicators in the CJPF to support their local planning and reporting cycles, as set out in the Act.

The first reporting period for the revised CJPF is 1 April 2023 to 31 March 2024. The first local annual reports aligned to this CJPF should therefore be published as soon as reasonably practicable following 31 March 2024 (as per s23 of the Act).

3. National Indicator Guidance

A table of the nationally determined outcomes and national indicators is included within the CJPF.

3.1 Sourcing of the national indicator data

This section sets out information on the source of the national indicator data.

The data for the majority of the 10 national indicators will be sourced from national available statistics (publications and dashboards) and supplied to CJPs by the Scottish Government. The national indicators were chosen based on both their ability to provide a suitable performance measure for the relevant outcomes, and the availability and consistency of the underlying data.

The data for one national indicator (see below) will need to be sourced by CJPs from management information (MI) systems within local authorities between June and September each year. The existing national statistics collection cannot provide this information for CJPs within the legislative reporting timeframe.

National indicator to be requested by CJPs from MI systems within local authorities:

Percentage of:

- community payback orders successfully completed
- drug treatment and testing orders successfully completed

In 2023, arrangements for sourcing the data required for three of the national indicators were still being made. Two of these indicators have since been sourced:

Number of transfers in drug/alcohol treatments from:

- custody to community

Percentage of:

- those in employability services with convictions

This information for 2023-24 will be made available to CJPs before the end of September 2024.

At the time of publication there was still one outstanding national indicator:

Number of:

- referrals from custody centres

When this indicator data is developed, the information will be supplied to CJPs and updates will be made to the relevant technical note in this document.

3.2 Supplying the national indicator data

This section sets out the arrangements in relation to the national indicators which the Scottish Government is supplying to CJPs.

3.2.1 First reporting year

For the first reporting year (1 April 2023 to 31 March 2024), where indicator data is available it will be supplied. Where possible, the data will cover the period from

2015-16 to 2022-23. This historical trend data will be supplied to CJPs in spring 2024.

The remaining data required for reporting purposes (data covering the period concerned, i.e. 2023-24) will be supplied by the Scottish Government to local areas when it becomes available, between June 2024 and September 2024. This will likely be via email, with the relevant link to the published information. There is one indicator which CJPs will need to request directly from local authorities during this period.

To reflect these arrangements, the expectation for partners to publish their local annual reports (as per s23 in the Act) in September will be extended to December each year. This expectation is set out in the statutory guidance to support statutory community justice partners to understand their roles arising from the Act (as per s24 of the Act). At the time of publication, an update to this statutory guidance is planned. Community Justice Scotland (CJS) retains the right to ask for local returns in its own timeframe for the purposes of reporting on performance and improvement.

3.2.2 Annual process

It is the intention of the Scottish Government that this will become the annual process i.e. historical trend data to be provided in spring each year and data relating to the relevant reporting year to be provided between June and September each year.

An illustration of this cycle is available in [Annex A](#).

The data will be supplied in an excel spreadsheet. A copy of the data will also be supplied to Community Justice Scotland.

Most of the data will be at a local authority level. Where data is from a higher geographical level, this will be supplied to the local authorities that it covers. For example, if a health board area covers three local authorities, the same information will be supplied to each of the CJPs covering those local authorities.

Technical information on each indicator is provided in [Annex B](#). Links to other published data sources have also been provided to support CJPs with more information relevant to the nationally determined outcomes.

3.3 How to use the national indicators

This section sets out suggestions that CJPs may find helpful in using the national indicators to measure performance in achieving the nationally determined outcomes.

- **Picking a base year.** When examining the current year data within a trend, it is important to pick a base year where it was 'business as usual'. It is advisable not to use 2020-21 and 2021-22, as a lot of the evidence has been affected by the COVID-19 pandemic, unless this is something you are wishing to measure. The choice of base year for each national indicator should be

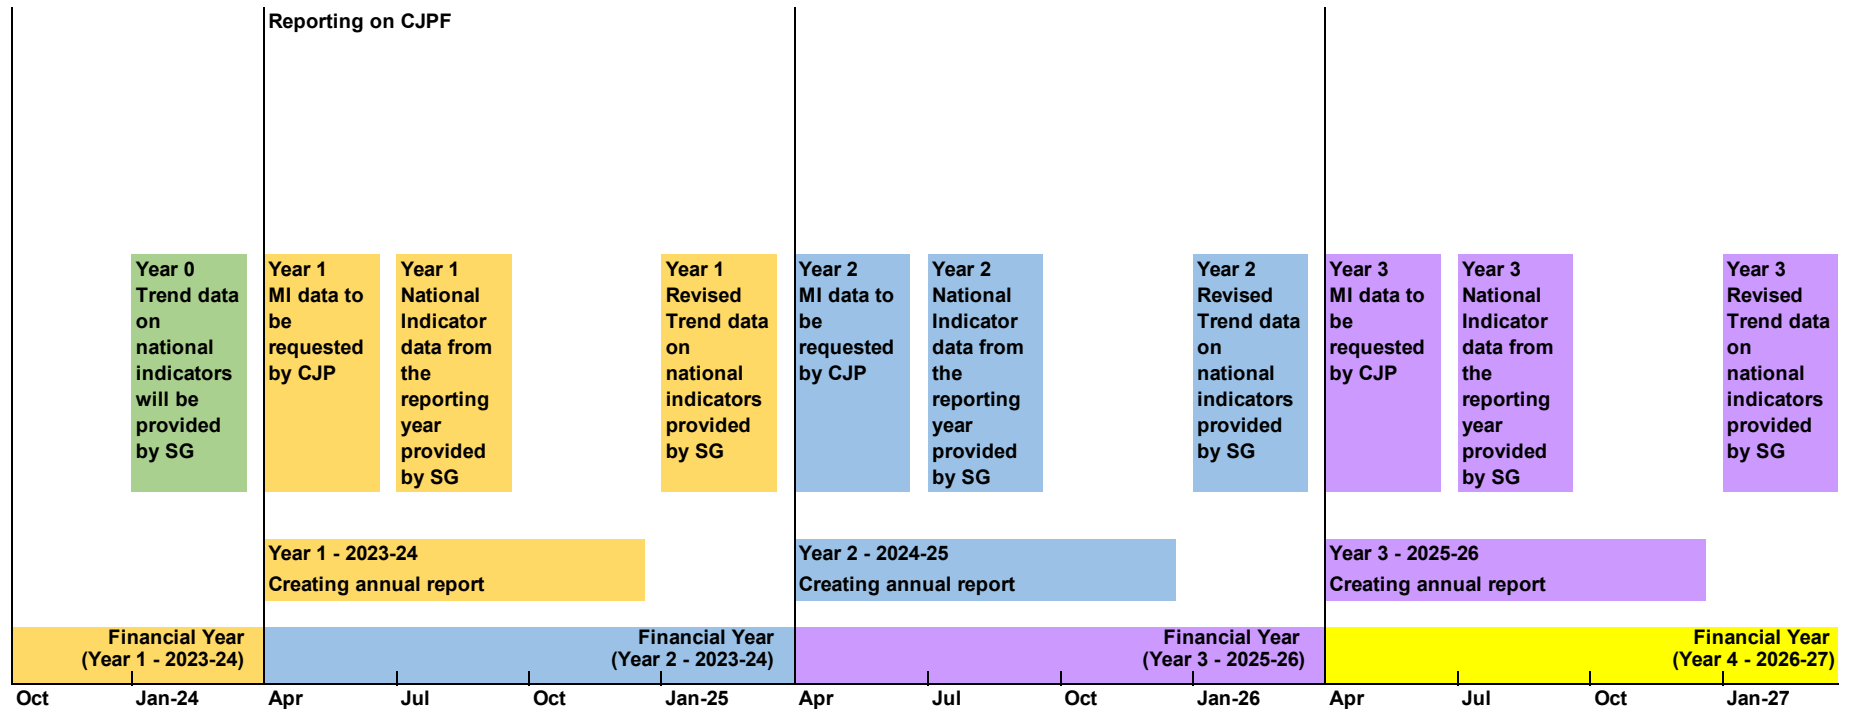

stated and kept constant throughout the lifetime of the current CJPF. Where available, historical trend data will be provided from 2015-16 onwards.

- **Use the indicators to identify where improvements need to be made.** An indicator measures change over time, so where possible it is important to look at previous comparable data (i.e. trend data) to see the pattern of movement. A base year should be chosen, and data should be compared and considered every year within the trend to see what movement is occurring across the CJP area. In general, indicators should be maintaining or improving over time. It is expected that monitoring within this framework will occur from the base year to the next revision of the CJPF.
- **Examining trend data.** When looking at the data from the relevant reporting period, it should be examined along with trend data. It is normal for data points to move up and down by small amounts (variability) throughout the years. Plotting the data points on a graph will show if there is a line or curve through the data which indicates a direction. It is important to look at trend data over at least four years where possible. This movement of indicators should raise questions for CJPs to discuss every year. For example:
 - Increasing – are we expecting a genuine increase or is this just natural variability? Has a programme/project been implemented in the past years and the data is beginning to reflect this? Has something changed in national policy or legislation that is creating improvement, how have the CJP contributed to this?
 - Stable – how long has the trend been stable? Is there anything that can be done to create improvement? If so, how long would it be before the data might change – a year or two years?
 - Decreasing – is this a genuine decrease or is this just natural variability? Has something happened that affected this work area e.g. global pandemic, funding implications, etc.? What can the CJP do to support improvement in this area?
- **Small numbers.** It is important to identify if the data contains small numbers. This is particularly relevant to percentages. For example, if you have ten people, one person would be 10% compared to if you had 40 people and one person would be 2.5%. If your data dropped 20 percentage points from one year to another – this could be only two people. It is important discuss this information in numbers rather than percentages. Local evidence may be more useful in explaining what is happening in the CJP area for small numbers. For example, low numbers may indicate that a service is not reaching your target group (if you are aware you have a large number of people in the target group), or that a third sector organisation is delivering the service and is not picked up by the national indicator.
- **Data revision.** Trend data related to the national indicators will be supplied every year by the Scottish Government. Some of the data sources allow for revisions and it is advised that the most recent trend data supplied each year is used. If there are revisions to trend data, these are normally very small, and we recommend highlighting these revisions in any reporting.

- **Use local evidence relevant to each outcome to explore specific improvements.** As set out in the CJPF, evidence collected at a local level will supplement the national indicator data. The national indicators will provide a measure of performance in achieving the nationally determined outcomes and indicate areas for improvement. Local evidence will provide further context to this and enable local analysis to be undertaken to explore specific improvements that may be needed. Further guidance on how this local evidence should be gathered and analysed will be set out by [CJS in Improvement Tools published on its website](#). There is an expectation that local areas will develop, gather and utilise information in collaboration with CJS in order to support ongoing improvement work and the achievement of the nationally determined outcomes. This includes an expectation that local areas will provide CJS with local evidence as part of their annual reporting for Scotland as a whole.

Annex A: Flow of data and reporting

This is an illustration of the intended flow of the data and reporting timeframe.

Annex B: Data sources and data information

High level national indicator: Disposal grouping split

Desired indicator direction

Decrease in percentage of custody disposals compared to other disposal groups. This a long term, very high-level indicator.

Movement of data should be considered every year and an awareness of what is happening in other disposal groups should be considered when reviewing this against other evidence.

Trend data source

[Scottish Government: Justice Analytical Services Criminal Disposals Dashboard](#)

The information reported within the dashboard is available quarterly. Data presented in the dashboard is based on MI supplied by the Scottish Courts and Tribunals Service. As such, results from the dashboard should be seen as providing a broadly indicative summary – rather than a precise measure of activity. The Scottish Government, where possible, will supply financial year trend data.

The data counts the number of disposals issued at charge level in Scottish criminal courts. The data does not tell you how many people received disposals, as each accused person can have multiple charges. Information is not included on charges for which the accused is not convicted.

The data provided is split into the following disposal groupings: custody, community, monetary, and other disposals.

The disposals under the four main categories are:

- Custody: Including Imprisonment, Detention in a Young Offenders Institution, Extended Sentences, Orders for Life Long Restriction (OLR) and Life Sentences.
- Community: Including Community Payback Orders (CPO), Restriction of Liberty Orders (RLO), Drug Treatment and Testing Orders (DTTO) and other community disposals not already mentioned.
- Monetary: Including fines and compensation.
- Other disposal: Any disposal which does not fall in any of the previous categories, including: admonishments, absolute discharge and a range of orders relating to mental health and other issues.

Local Authority information based on the offender's postcode is presented. Postcode information is not available for all disposals and some of the available postcodes are non-Scottish. Completeness of Local Authority information based on a valid Scottish postcode is currently 76%. Completeness rates can vary considerably by different characteristics of the data.

Nationally determined outcome: More people are assessed for and successfully complete bail supervision

National indicator

Number of:

- assessment reports for bail suitability
- bail supervision cases commenced
- bail supervision cases completed

Desired indicator direction

Increase from the base year to the year of the next revision of the CJPF. Movement of data to be examined and considered every year.

Trend data source

Scottish Government: National Statistics

[Justice Social Work Statistics – additional tables](#)

Download: JSW local authority tables for courts and bail

The source of this data is Justice Social Work statistics, this indicator is on bail supervision only. Bail supervision is a social work or third sector service that supports people to comply with the conditions of their bail.

This data is limited to information that is provided and collected from justice social work management systems. Justice social work services undertake assessments of suitability for bail (including bail supervision and/or an electronic monitoring order) and provide reports to the court. They provide bail supervision services (either directly or via a commissioned third sector organisation) based on local needs and priorities. Bail supervision commences when the court imposes a bail supervision condition. Bail supervision case completion is when the period of bail supervision ends and when an individual has met all the terms of their bail supervision.

Assessment reports for bail suitability and bail supervision cases completed have been collected for the first time in 2022-23. Local authorities were only advised during year 2022-23 of the change to the collection for that year. It would therefore be expected, as any collection of new information needs time to standardise, that the quality of the new statistics will not be as good as data which has been collected over a longer period of time. As a result, the statistics for bail supervision are classified as “official statistics in development”. Apart from bail supervision cases commenced which has been collected for over a decade.

The information for assessment reports for bail suitability and bail supervision cases completed has been supplied for information purposes only. It is advised against making 2022-23 the base year. Local authorities have identified changes needed to guidance to improve consistency in the collection for 2023-24.

Trend data source

Public Health Scotland: National Drug and Alcohol Treatment Waiting Times

[Annual data tables](#)

This indicator is sourced from Public Health's Scotland Drug and Alcohol Information System (DAISy) dataset. It describes the number of custody to community continuation of care transfers for specialist drug, alcohol or co-dependency (both alcohol and drug) treatment in Scotland in each financial year. A continuation of care transfer occurs when a person is transferred between services that provide the same specialist care, allowing treatment to continue without delay.

The continuation of care process affects how waiting times are recorded when people who are already in treatment move from one service provider to another i.e., from prison to community. In DAISy, if there is no break or change in the patient's treatment, no waiting time needs to be recorded at the receiving service.

These data describe the number of referrals in the financial year that are transferred between different service providers without incurring a delay in treatment. As multiple referrals may be necessary to transfer all elements of specialist treatment, these figures should not be interpreted as indicative of the number of individuals subject to continuation of care transfers. NHS Board / ADP figures are based on the service receiving the continuation of care transfer. Please note, Clackmannanshire and Stirling are reported as two separate ADPs at the ADP's request.

These data are estimated to be of high quality - quarterly returns are signed off by Alcohol and Drug Partnership co-ordinators and data are subject to rigorous quality assurance checks.

The Scottish Government is working with relevant community justice partners to develop an indicator that shows the continuity of drug and alcohol treatments from a prison setting to a community setting. This indicator will be sourced from Public Health's Scotland Drug and Alcohol Information System (DAISy) dataset.

Frequency of trend source publication

Published quarterly as part of [National Drug and Alcohol Treatment Waiting Times](#) but data at NHS Board and Alcohol and Drug Partnerships (ADPs) level in the annual tables only. Nationally determined outcome: More people have access to suitable accommodation following release from a prison sentence

National indicator

Number of:

- homelessness applications where prison was the property the main applicant became homeless from

Desired indicator direction

Decrease from the base year to the year of the next revision of the CJPF. Movement of data to be examined and considered every year.

Trend data source

Scottish Government: [Homelessness in Scotland: prison homelessness](#)

The Scottish Government publishes bespoke secondary analysis for 'prison service homelessness' in the form of data tables, following the release of annual [Homelessness statistics](#) publications. This includes data for homelessness applications, by local authority, where the main applicant reports prison as the property type they have been made homeless/threatened with homelessness.

Prison should be recorded where an applicant has given up or lost accommodation for a stay in prison, irrespective of the length of time in prison.

Where the applicant has been staying in accommodation on a temporary basis prior to making a homelessness application, including staying with friends or relatives, for a period of less than six months because he or she had already become homeless prior to the application being made, the property type from which the person became homeless should be recorded, not the temporary accommodation.

This data does not capture individuals who have been released from prison to known accommodation for over 6 months as this 'known' accommodation would be recorded as the property type, and not prison.

This trend data allows for revisions, in general the changes are small. The most current trend data published should be used for reporting.

[Scottish Crime and Justice Survey](#)

Module B – Sentencing

The Scottish Crime and Justice Survey (SCJS) is a large-scale social survey which asks people about their experiences and perceptions of crime in Scotland. The sample is designed to be nationally representative of all private residential households in Scotland.

The SCJS also gathers information on attitudes towards prisons and community sentences to understand what the public thinks about the process of sentencing and rehabilitation. It is important to note that questions on attitudes towards community sentences within the SCJS are asked without reference to specific crime circumstances or individuals backgrounds, which may influence opinions about what constitutes a suitable sentence or approach.

The SCJS gathers information from a sample rather than from the whole population and, although the sample is designed carefully, survey results are always estimates, not precise figures. This means that the results are subject to a margin or error which can have an impact on whether we can say whether any change between two years (or specific categories in a single year) represent a real change. If there is no significant found, we can be 95% confidence there is no different in the percentages reported between the two surveys. (More technical information can be found in [Annex E](#) of the most recent population)
